For simplicity, atypical organisms are not included above. Partial columns indicate incomplete coverage. ESBL-producing organisms are not susceptible to most antibiotics containing a beta-lactam ring; carbapenems are the usual agent of choice.

1: *C. difficile* should only be treated with metronidazole or vancomycin. 2: ESCHAPPM are β -lactamase producing organisms. These are *Enterobacter*, *Serratia*, *Citrobacter freundii*, *Hafnia*, *Acinetobacter/Aeromonas*, *Proteus (not mirabilis)*, *Providencia* & *Morganella morganii*.

3: Not effective against *Clostridium*. 4: Metronidazole is not effective against *Peptostreptococcus*, 5: Teicoplanin is not effective against *Enterococcus faecium*, 6: Gentamicin is not appropriate mono therapy for *Staphylococcus aureus* & should only be used in conjunction with a β -lactam.

7: Due to increasing MIC, Cefuroxime is not recommended therapy for *Moraxella*. 8: Although it has other actions, Ceftazidime should only be used for *Pseudomonas*.
