Pelvic Fracture Data

Mark Hemmila, MD

AAST Presentation/JTACS Paper

AAST 2018 Podium Paper

American College of Surgeons Committee on Trauma verification level affects trauma center management of pelvic ring injuries and patient mortality

Bryant W. Oliphant, MD, MBA, MSc, Christopher J. Tignanelli, MD, Lena M. Napolitano, MD, James A. Goulet, MD, *and* **Mark R. Hemmila, MD**, *Ann Arbor, Michigan*

BACKGROUND: Pelvic ring fractures represent a complex injury that requires specific resources and clinical expertise for optimal trauma patient management. We examined the impact of treatment variability for this type of injury at Level I and II trauma centers on patient outcomes.

METHODS: Trauma quality collaborative data (2011–2017) were analyzed. This includes data from 29 American College of Surgeons Committee on Trauma verified Level I and Level II trauma centers. Inclusion criteria were adult patients (≥16 years), Injury Severity Score of 5 or higher, blunt injury, and evidence of a partially stable or unstable pelvic ring fracture injury coding as classified using Abbreviated Injury Scale version 2005, with 2008 updates. Patients directly admitted, transferred out for definitive care, with penetrating trauma, or with no signs of life were excluded. Propensity score matching was used to create 1:1 matched cohorts of patients treated at Levels I or II trauma centers. Trauma center verification level was the exposure variable used to compare management strategies, resource utilization, and in-hospital mortality in univariate analysis.

RESULTS: We selected 1,220 well-matched patients, from 1,768 total patients, using propensity score methods (610 Level I and 610 Level II cohort). There were no significant baseline characteristic differences noted between the groups. Patients with pelvic ring fractures treated at Level I trauma centers had significantly decreased mortality (7.7% vs. 11.6%, $p = 0.02$). Patients treated at Level II trauma centers were less likely to receive interventional angiography, undergo complicated definitive orthopedic operative treatment, and to be admitted to an intensive care unit.

CONCLUSION: Admission with a partially stable or unstable pelvic ring injury to a Level I trauma center is associated with decreased mortality. Level II trauma centers had significantly less utilization of advanced treatment modalities. This variation in clinical practice highlights potential processes to emphasize in the appropriate treatment of these critically ill patients. (*J Trauma Acute Care Surg.* 2019;86: 1–10.

LEVEL OF EVIDENCE: Economic/Decision, Level II.

KEY WORDS: Trauma outcomes; trauma registry; quality improvement; collaborative quality improvement; complications.

Conclusions

- Different kinds of patient
  - Level 2, keep
  - Level 1, keep
  - Level 2 transfer to Level 1
  - Others (triple jump, Level 3 to Level 1, non-trauma to trauma)
- Analysis
  - Patients were matched for transfer in status
  - Were not matched for type of facility transferred in from
  - 20% of patients were transferred in
- Future
  - May be able to tell who was transferred where

Failure to Rescue

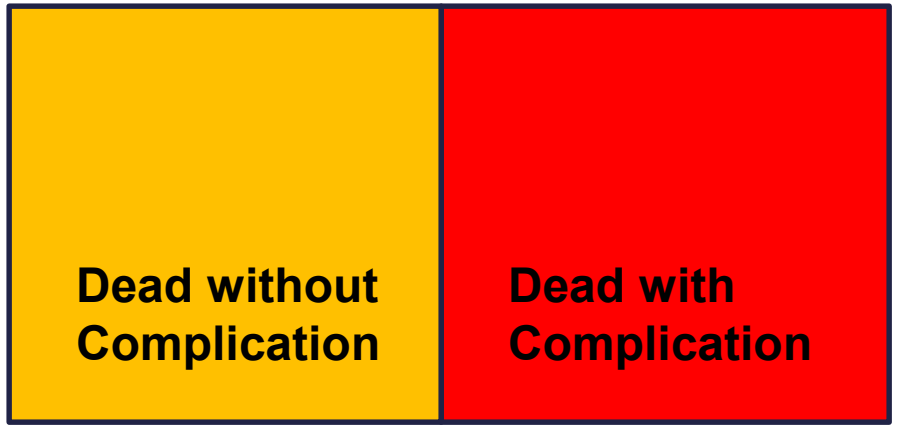
Failure to Rescue



Failure to Rescue

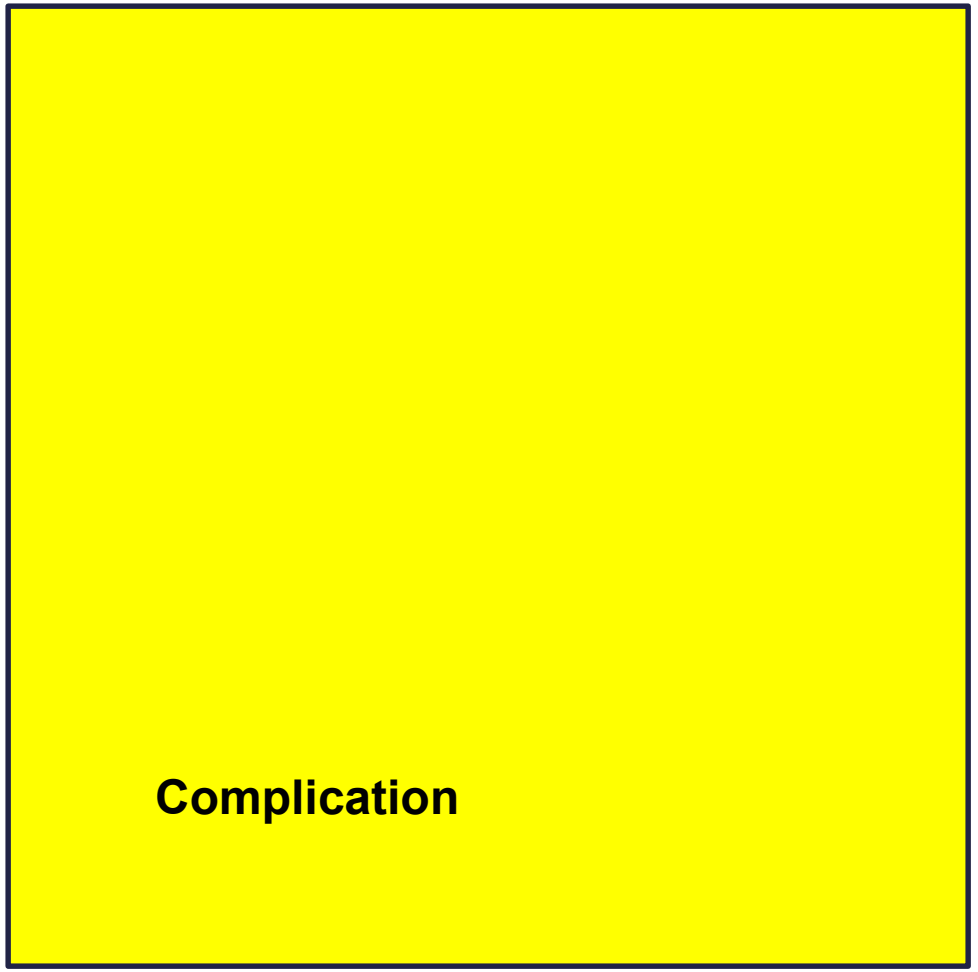
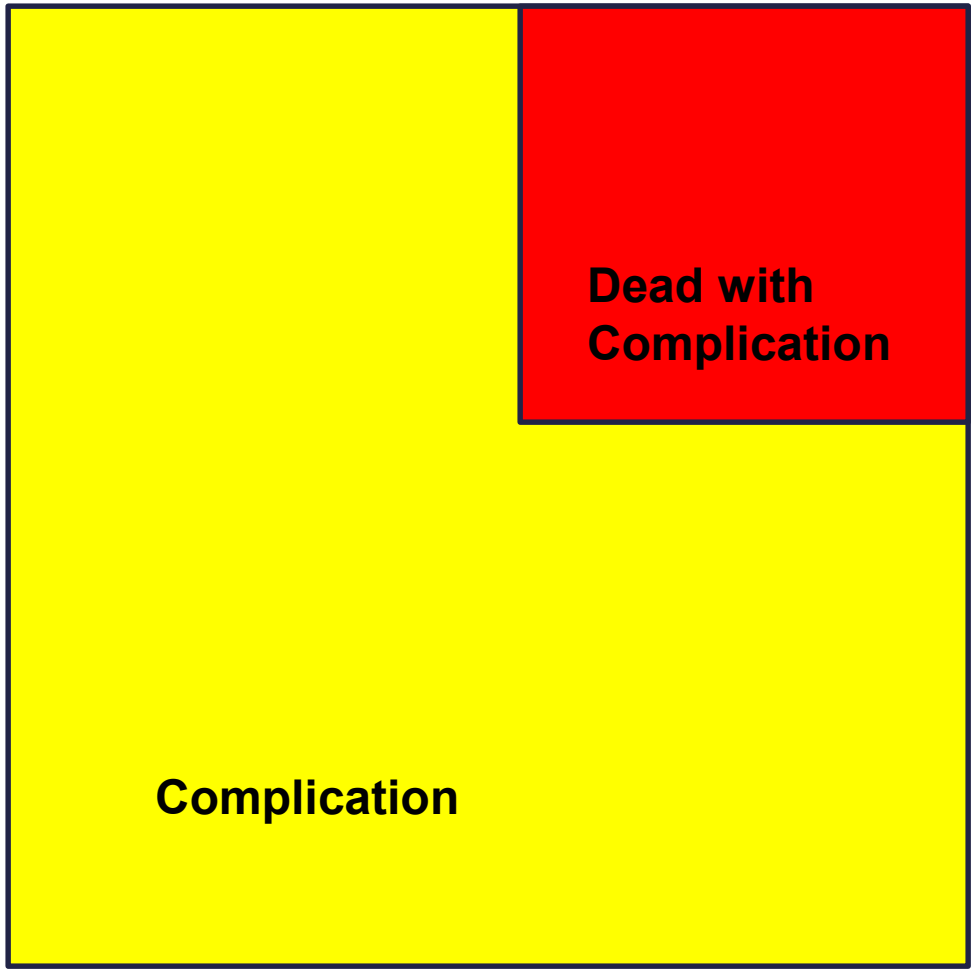
$$\text{Failure to Rescue} = \frac{\quad}{\#\ \text{Complication}}$$

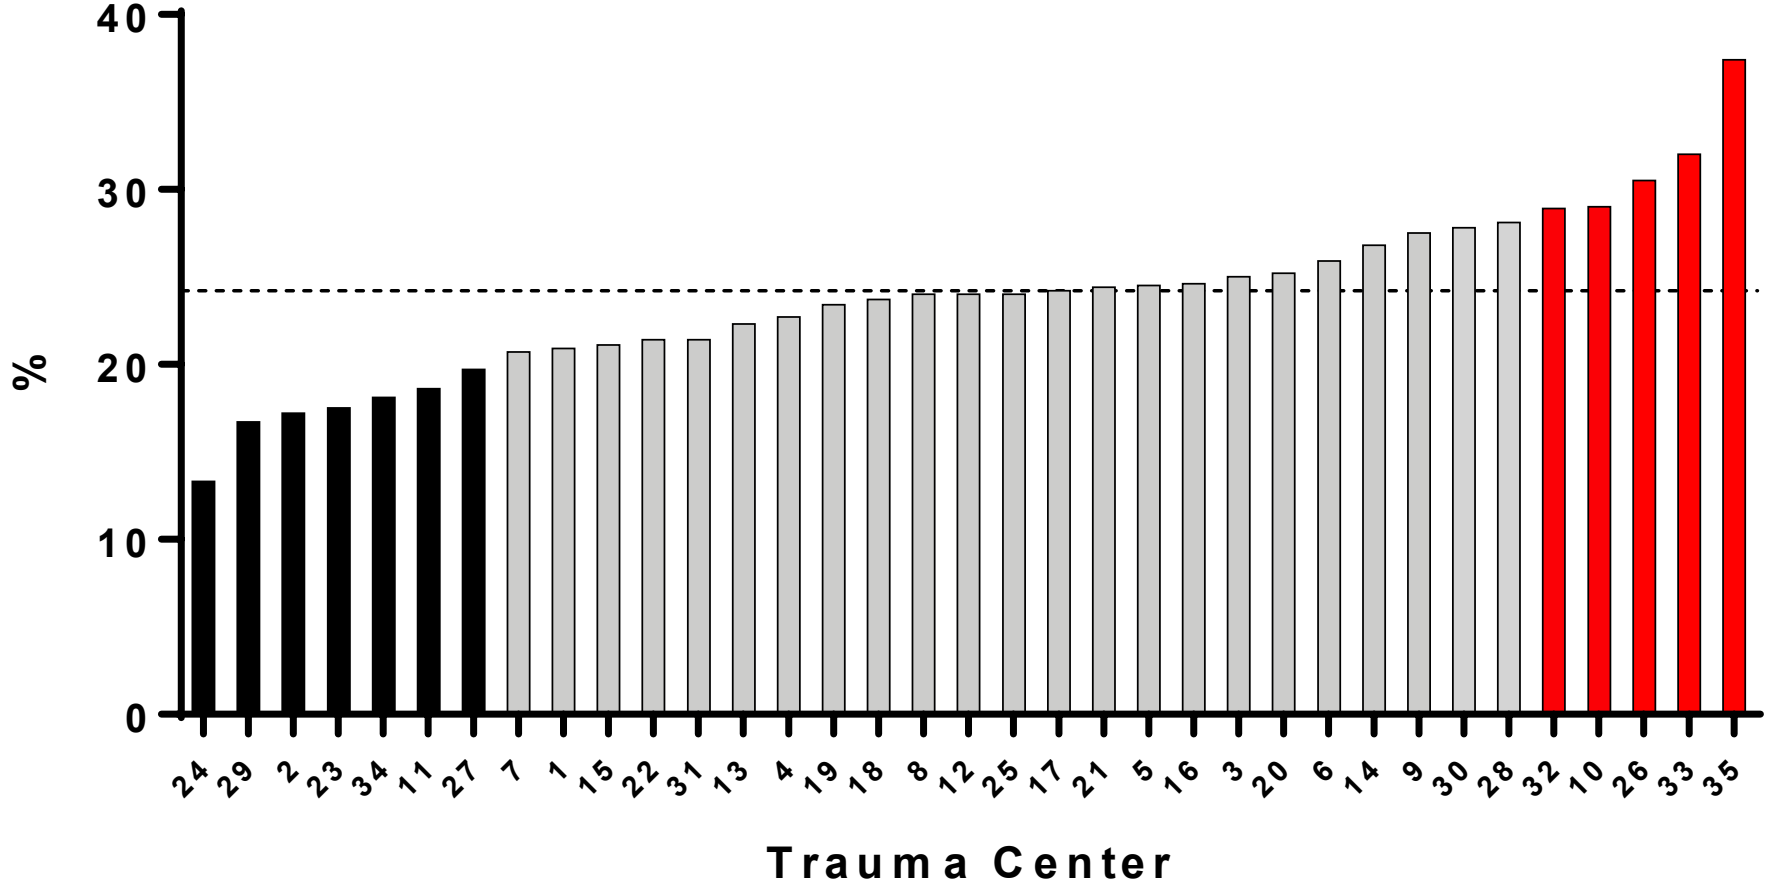


Failure to Rescue

$$\text{Failure to Rescue} = \frac{\#\ \text{Dead w/Comp}}{\#\ \text{Complication}}$$



Failure to Rescue
Cohort 2 - Admit to Trauma



Failure to Rescue

Center 9

Failure to Rescue
Denominator: All cases having serious complication, dead or alive.
Numerator: All cases with mortality, preceded by complication Severity II or III.

Grade II Complications

- Decubitus Ulcer
- DVT: Lower Extremity
- DVT: Upper Extremity
- Enterocutaneous Fistula
- Extremity Compartment Syndrome
- Pneumonia
- PE
- Unplanned Return to OR
- Unplanned Admit to ICU

Grade III Complications

- Acute Lung Injury/ARDS
- Acute Kidney Injury
- Cardiac Arrest with CPR
- Mortality
- Myocardial Infarction
- Severe Sepsis
- Stroke/CVA
- Renal Insufficiency
- Unplanned intubation
- C. Difficile Colitis

Failure to Rescue

Center 9

- Level II Adult Trauma Center
- Service area is 9 counties in MI
- Acute Care Surgery/Trauma Service
  - 5 Attending's with 2 prn taking call
  - Residents in conjunction with WMED
  - 1 Advanced Practice Provider M-F days.

Demographics

- 12 patients from Nov 1, 2015-Jan 31, 2018
- 10 over the age of 65
- 7/12 Palliative Care/Withdrawal of Support
- Ground Level Fall-4
- MVC-6
- Bike vs Car-1
- Assault-1

Drilldown

- This is a very broad data definition
- 3 Categories of patients:
  - True “Failure to Rescue”…critical systems or personnel failures (Cat. 1)
  - General categories of decline possibly indicating a blind spot in your system (Cat 2)
  - Clear palliative or “end of life” care without the ability to rescue, despite the premorbid identification of a severe complication (Cat 3)

Drilldown II

- Of those 12 patients,

  1 Cat 1

  5 Cat 2

  6 Cat 3

Category 1 patient

- Elderly woman t-boned on drivers side brought hypotensive to ED with pelvic fracture, transient responder, diagnosed rapidly, taken to IR.
- Both trauma staff surgeon and ED resuscitative nurse left IR suite. IR nurse removed binder in haste as patient was declining; lost pulses, died.

Category 2

- Elderly anticoagulated pt with multiple comorbidities admitted to ICU with small subdural, reversed with 2 U FFP and Vit K, transferred stable to floor, PEA arrest on floor HD day 3.

Category 3

- Severely demented elderly pt GLF at AFC with small intraventricular hemorrhage. ICU, then floor. Severe aspiration/dysphagia, pneumonia diagnosed HD 2, declined on floor, returned to unit. Family requested comfort care only after discussion/clarification of goals of care with attending staff.

Why are we at this Status?

- We have a very low major complication rate within the collaborative, and mortality rate is on the high end.
- Nature of the cases and the philosophy with which our team handles them as noted previously

What we do well

- Well developed Palliative Care Program
- Acute Care Surgery Team comfortable initiating a conversation about end of life care
- Start conversations early with patients and family about long-term prognosis

Opportunities Identified

- Clarified the process of who follows with patients to ancillary departments for procedures.
- Clarified roles of nursing and physician staff in ancillary departments.
- I personally, and our attending staff learned some lessons about team management and situational awareness

How do we Sustain the Change

Review all charts that require patient going to ancillary departments.

- TPM attends trauma activations.

Moving Forward

- Continue monitoring of ED process for Tier 1 (Full activation) patients
- Continue to use this tool to identify my Category 2 patients to identify any patterns of failure not identified through our routine PI process.
- Surgeons and program staff also need to be paying attention to patterns, e.g.: hips.

Failure to Rescue

Center 23

- Level II Adult-Only
- Region
- Geriatric: Falls & Motor Vehicle Crashes
- 1350 Cases Annually

Trauma Service

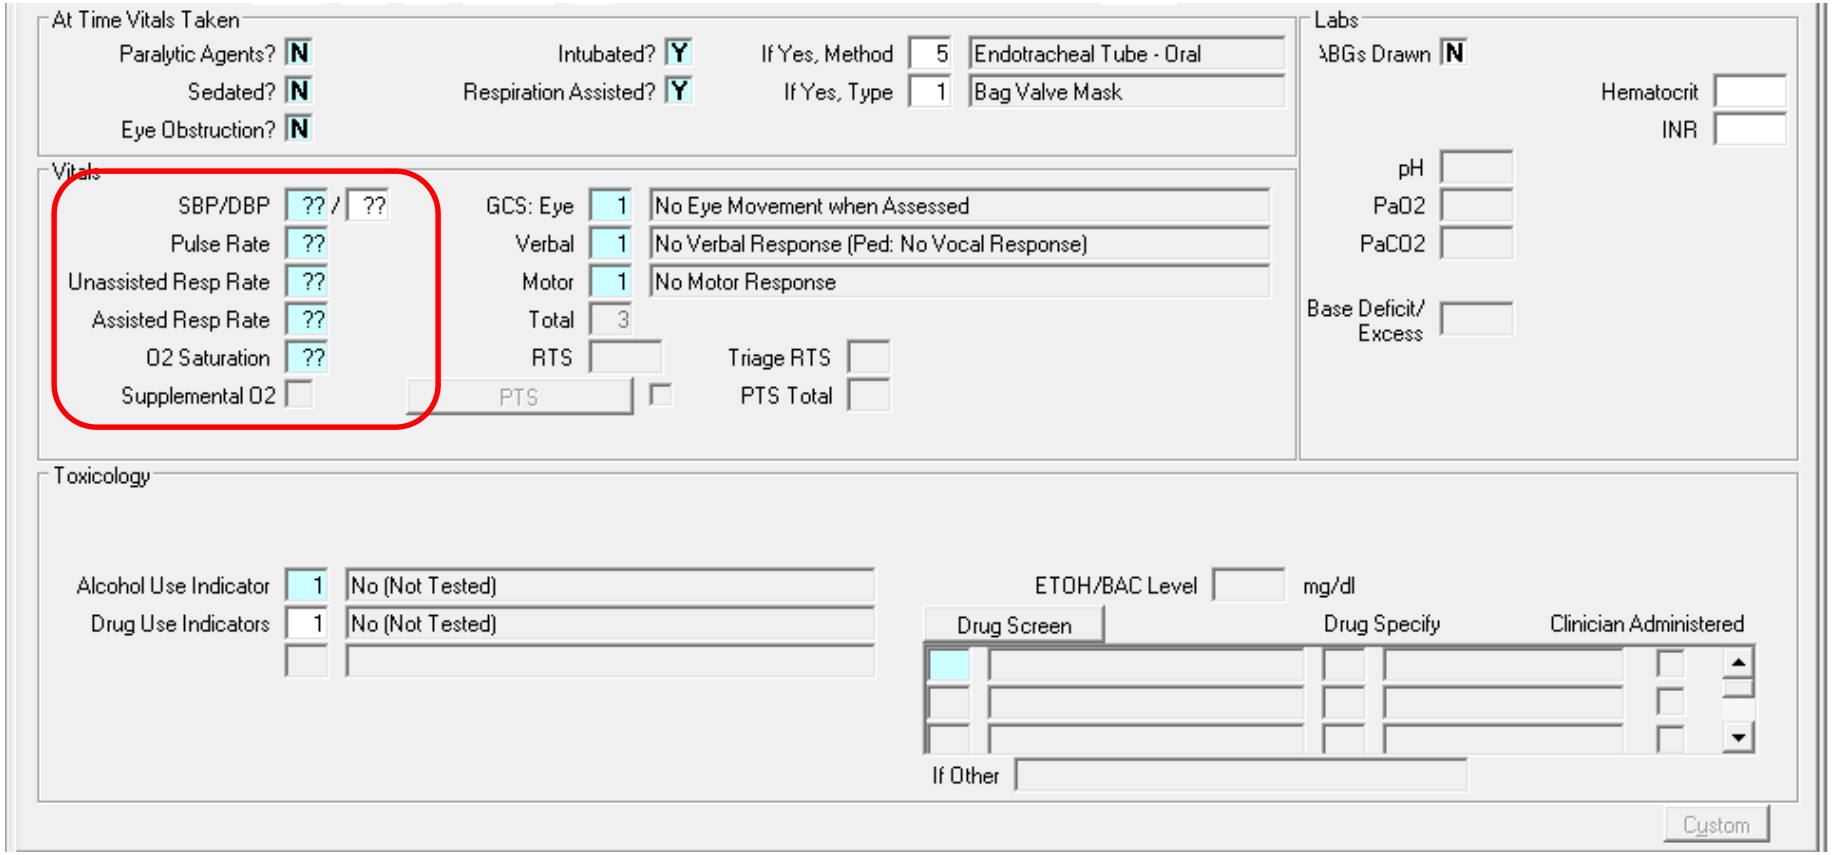
- Five (5) call panel, in-house surgeons 24/7.
- Two (2) Surgical Intensivists.
- General Surgical resident assigned monthly.
  (ACGME/MSU)
- Trauma Nurse Coordinators (01/16).

Failure to Rescue: 10/41

(24% unadjusted/ 18% adjusted)

- **Average Age**: 65
- **Average ISS**: 25
- **CPR -Field/Scene/Enroute/ED**: 3/10 (30%)
- **Cardiopulmonary Complication**: 7/10 (70%)

Data concern



“**Rescued**”: n=41

- **Average Age:** 66
- **Average ISS**: 19
- **CPR (Field/Scene/En route/ED):** 3/41 (7%)
- **Cardiopulmonary Complication:** 28/41 (68%)

Low Outlier: Reasons

- **Validated Data:** Two (2) consecutive five (5) star data validations.
- **Consultants:** Geriatrics, Palliative Care and Hospice
- **Trauma Nurse Coordinators (TNC):** Added first in January 2016, second 2018
- **Management:** Once complication identified-aggressive management.

What We do Well

- **Consultants:** Geriatrics, Palliative Care and Hospice

Moving Forward

- **Pneumonia Complication**:
  - ✓Drill down & identify opportunities
  - ✓Should improve Failure to Rescue & Pneumonia

- **Staff Adds (Sustain & Improve):**
  - ✓ Additional 1.0 FTE-Trauma Nurse Coordinator
  - ✓2.0 FTE Advanced Practice Providers

- Adherence to definitions and quality data.

Failure to Rescue

About our facility…

- ACS verified Level II Adult Trauma Center

- Volume: 1000 trauma registry patients
  - 800 patients meet MTQIP inclusion criteria
  - 570 patients admitted to trauma service
  - 54% patients ≥ 65 years of age
  - 96% blunt MOI

- Composition of trauma service:
  - 6 trauma call surgeons
  - Consistent trauma service physician coverage 1 week at a time
  - Daily APP coverage 7a-5p, new nightshift APP coverage started 3/2018

Failure to Rescue Status

Failure to Rescue

- Step # 1 understanding the definition…
- Exclude DOA

$$\frac{\text{All deaths, admitted to trauma, ISS} \geq 5\text{, that had grade 2 or 3 complication}}{\text{Total Patients with Grade 2 or 3 Complications}}$$

Failure to Rescue Drill Down

Overall mortality and complications-not a high outlier, why failure to rescue??

- 18 patients included in FTR cohort
  - 3 patients died in ED
  - 15 patients admitted
    - 53% > 65
    - 12 patients withdrawal of care
- Clarify Data definitions:
  - 1 patient did not meet inclusion criteria-arrived without signs of life BP=0, HR=0, GCS=3. Clarification on registry data capture.

Failure to Rescue Drill Down

- Common trends/themes?

Mortality Review:

- Withdrawal of care- was it related to complication vs injury?
- Provider / process issues?

Complication Review:

– Ventilator Associated Pneumonia: 4 patients

- Hospital wide PI project to decrease VAE
  - Ventilator Protocols focused on decreasing VAE
  - Standardization of nursing/ RT care

Failure to Rescue

Conclusion…

- No “Smoking Gun” or overwhelming trend that contributed to our FTR rates.
  - Small volume makes it difficult to identify trends
- FTR is beneficial as a secondary audit filter for a high level overview for trends in complications/ mortality, and overall PI process.
    - VAP identified as a complication that needs addressed
    - Monitor provider trends

Questions??

About Us

Center 10

- ACS Verified Level I Adult and Level II Pediatric Center
- ED Volume 120,000 annually
- Trauma registry volume 2500 annually
  - Blunt: 80%
  - Penetrating: 18%
  - Burn: 2%

About Us

Center 10

- 10 Attending surgeons taking call
- Numerous residency and fellowship programs
- Trauma Service- Resident run with 1 MLP on days/ 1 MLP on nights
  - Trauma Program Manager
  - 5 registrars
  - 2 MCRs
  - Pediatric Coordinator
  - Injury Prevention coordinator
  - Administrative assistant

Definition

Failure to Rescue

- Age ≥16
- ISS ≥ 5
- Hospital LOS ≥ 1 day or dead
- Exclude DOA
- Admit to trauma service (Cohort 2)
- Patients with Grade 2 or Grade 3 Complication
- Failure to rescue = n dead with complication / n with complication

Definition

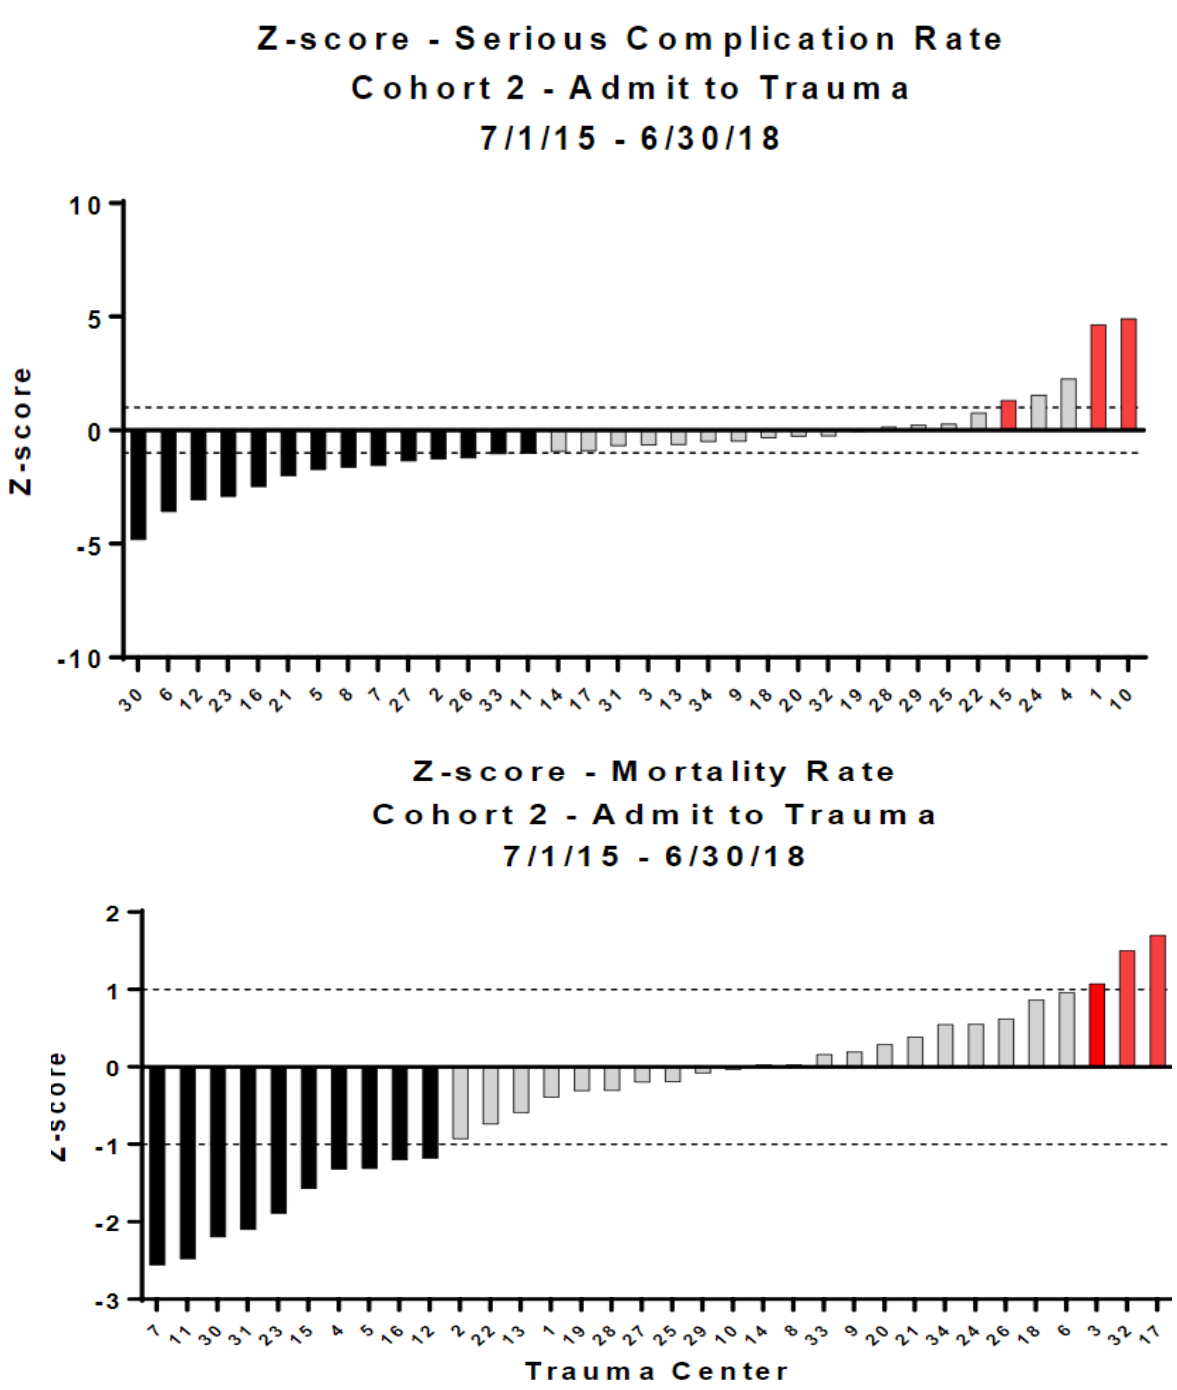
Failure to Rescue

Grade 2 Complications	Grade 3 Complications
• Unplanned ICU admit • Pneumonia • Unplanned return to OR • DVT/PE • Decubitus ulcer • Cdiff. • Enterocutaneous fistula • Extremity compartment syndrome	• Cardiac arrest with CPR • Acute Kidney Injury • ARDS • Myocardial Infarction • Unplanned Intubation • CVA • Severe Sepsis • Acute Renal Insufficiency • Mortality

Failure to Rescue Status

Center 10

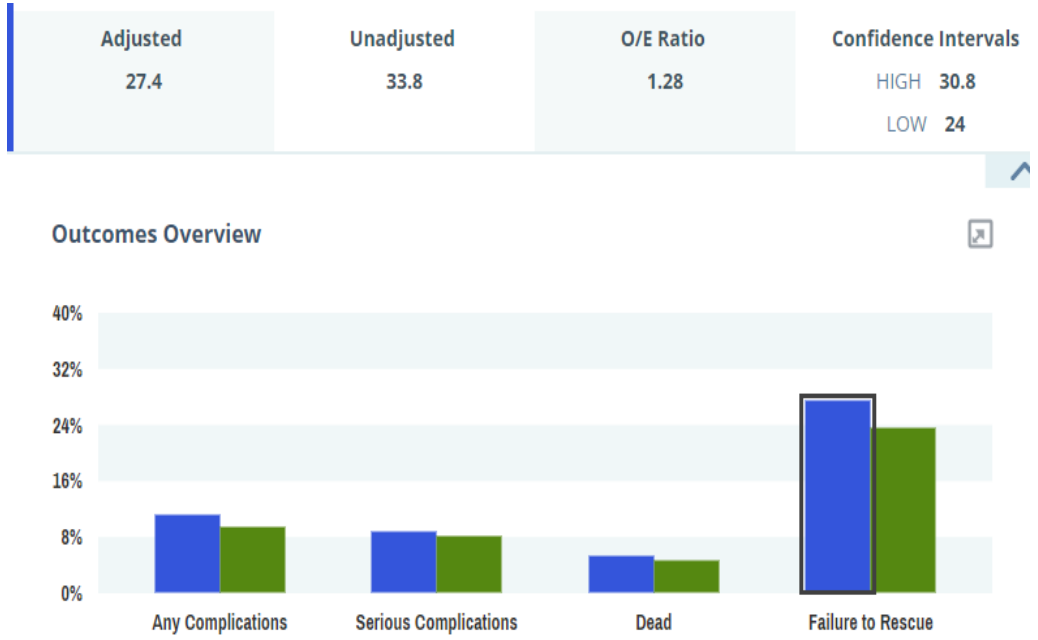
- Serious complication Z score has increased (high outlier)
- Mortality rate Z score has remained consistent (average performance)
- Addition of 1st MCR 04/2016
  - 2nd MCR 01/2018

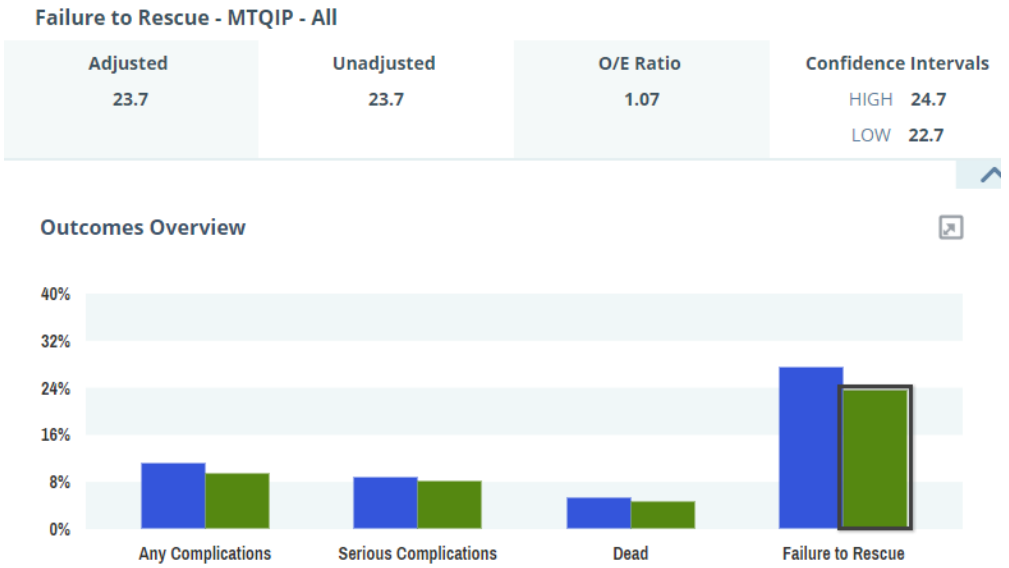


Failure to Rescue Status

Center 10

- July 1, 2015-December 31, 2018
- ASJH Adjusted FTR rate: 27.4%
- MTQIP Adjusted FTR rate: 23.7%





Drilldown

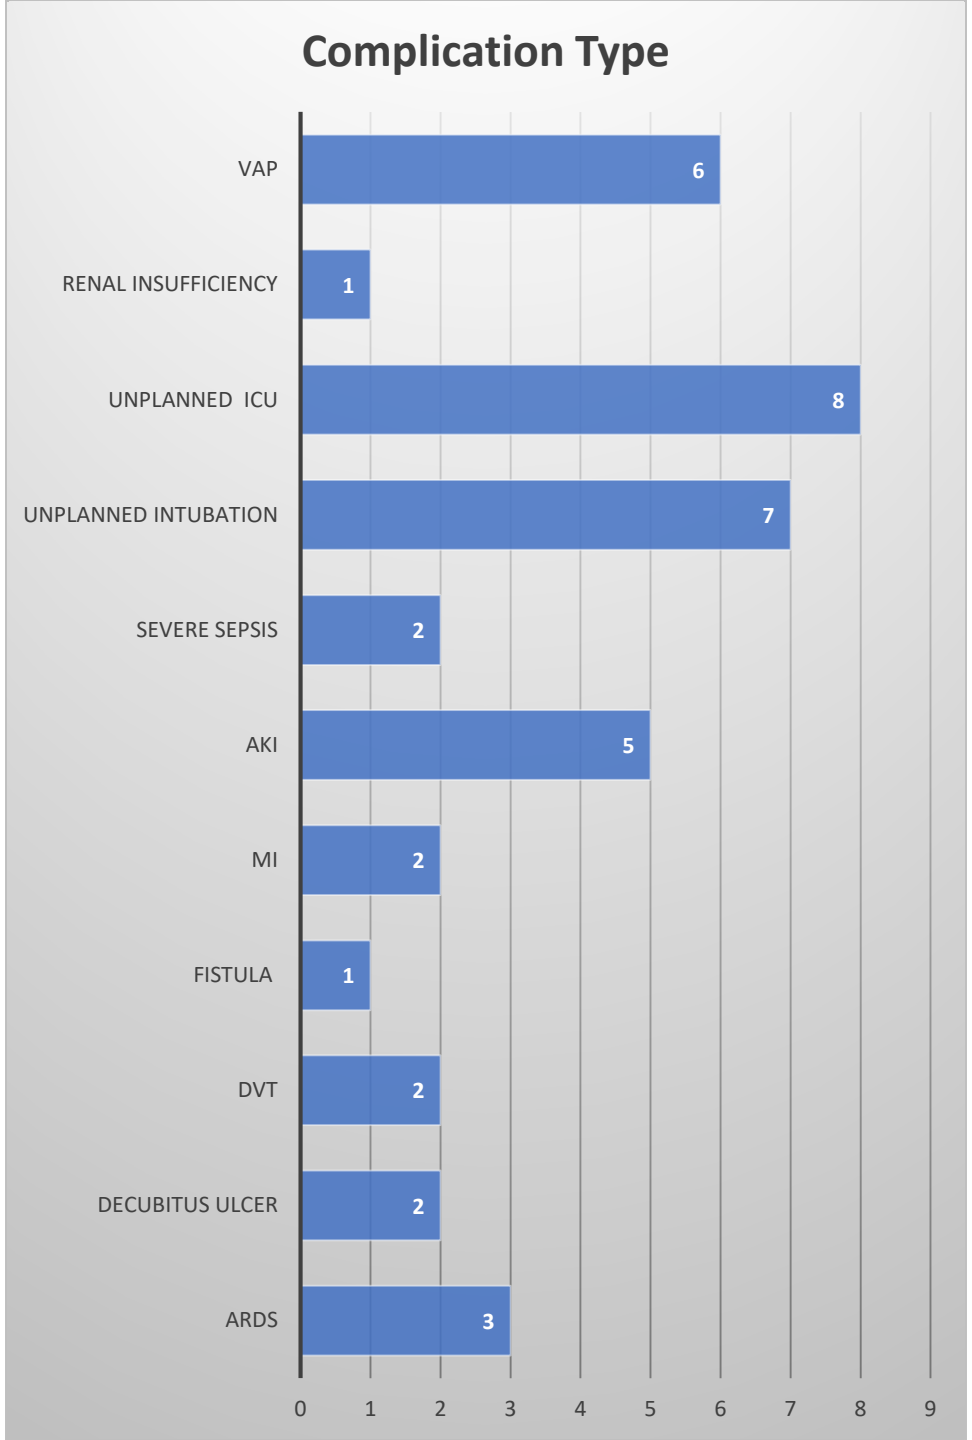
- 70 patients identified
- Average ISS 26.2
- Average age 56.9 years
- Blunt 65% (45)
- Penetrating 35% (25)

Center 10

- Out of 70 patients identified, **52** had CPR as one of the complications.

- Of the 52 patients with CPR
  - 54% Blunt
  - 46% Penetrating

- 41 of the 52 (**79%**) had CPR within 1 day of arrival.
  - Average ISS: 33.4
  - Average Age: 43.5
    - Of the 41 patients
      - 56% Penetrating, Avg. age 36, Avg. ISS 28
      - 44% Blunt, Avg. age 53, Avg. ISS 41



Failure to Rescue Status

Center 10

- 18 patients were identified as having no CPR but other complication(s)
  - Average ISS: 14.5
  - Average Age: 81.2 years
    - Blunt: 94%
    - Penetrating: 6%
- Unplanned ICU: 44%
- Unplanned intubation: 39%

Reasons

- Collecting complications more accurately since the addition of MCRs.
- Despite complication rate increasing, mortality rate has remained the same.
- 79% of patients had an episode of cardiac arrest within Hospital Day 1
- Geriatric trauma

Moving Forward

- Opportunities for a more robust drilldown into FTR
  - Patients with CPR greater than Hospital day 1
  - Patients with multiple complications

- Geriatric Trauma Protocols
  - Early Geriatrician Consults
  - ICU admission
  - Aggressive pulmonary toilet
    - Early tracheostomy

- Palliative care consults

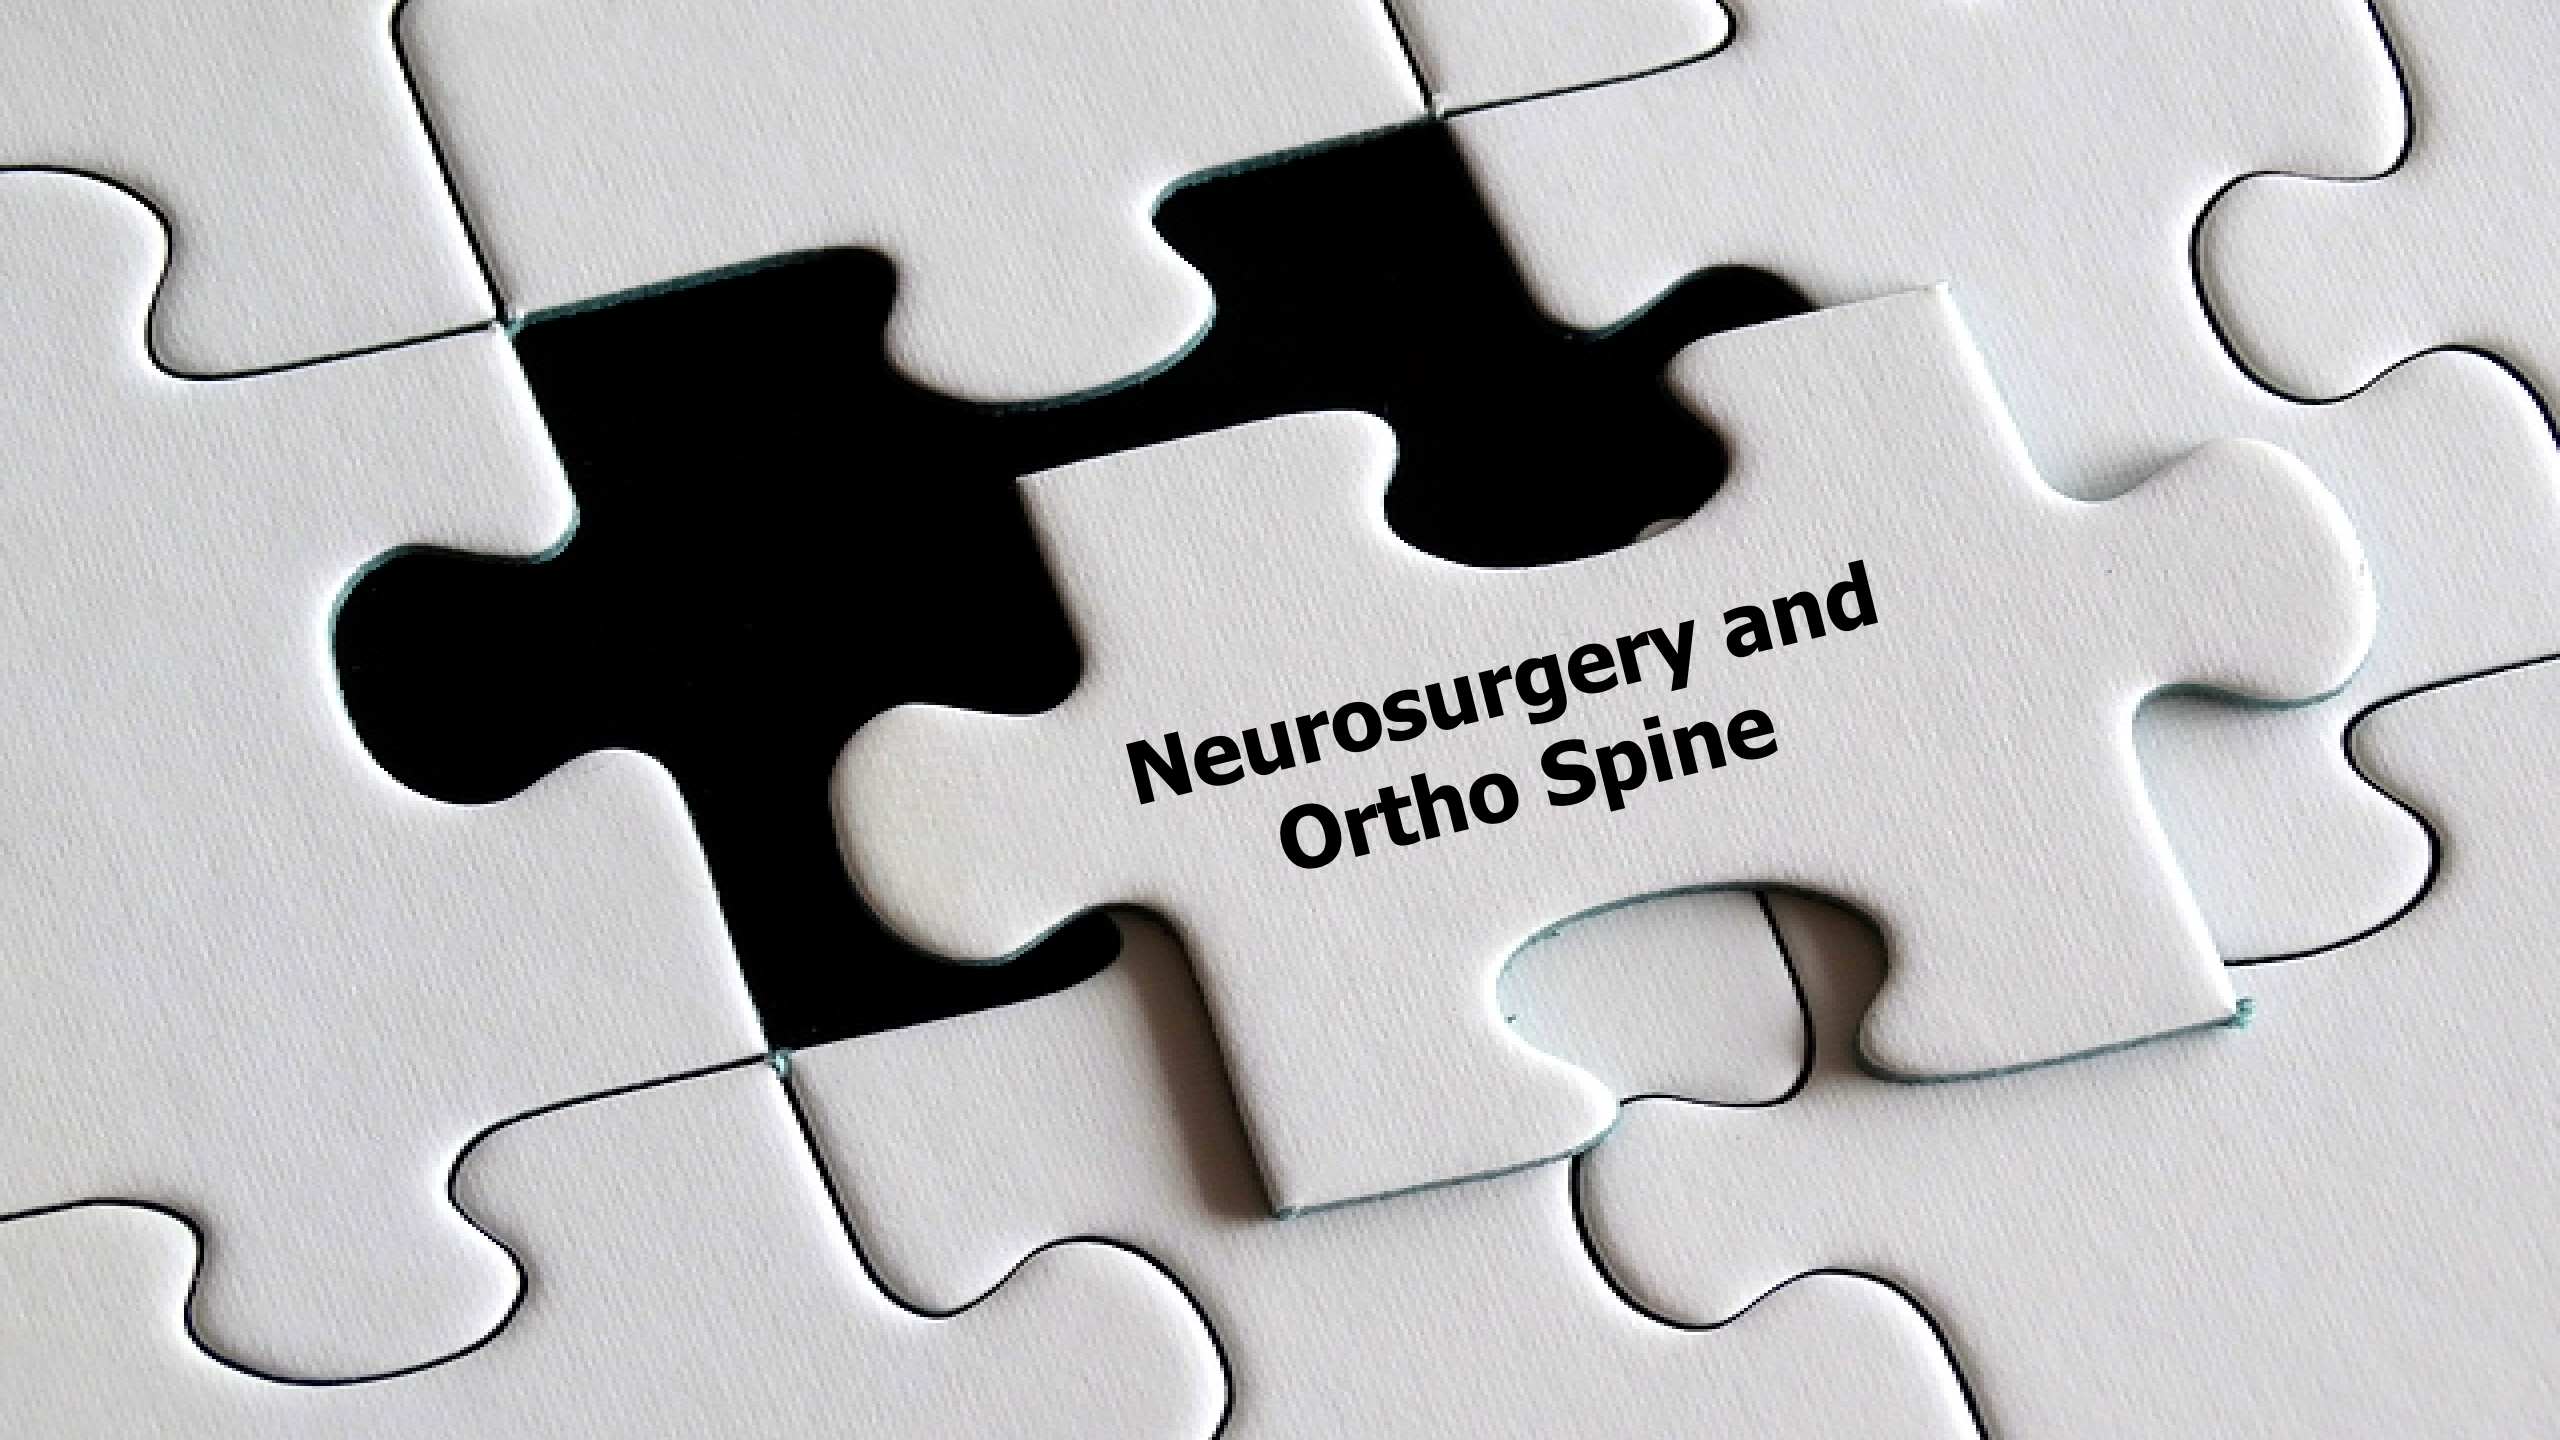
TBI/Spine Fracture Data

Jill Jakubus, PA-C

Mark and Jill,

Do you have data on what percentage of patients with TBI or spine fractures receive LMWH within 48 hrs in the MTQIP database? I'd love to be able to present that data to my neurosurgeons.



Neurosurgery and
Ortho Spine

Outcomes in Trauma Patients on Anticoagulation and/or Antiplatelet Therapy

Wendy Wahl

Association of Mortality among Trauma Patients Taking Pre-Injury Direct Oral Anticoagulants vs. Vitamin K Antagonists

Zachary Laduke, Pharm D, Jason P. Hecht, Pharm D, Anne Cain-Nielson, MS,
Mark R. Hemmila, MD, FACS, Wendy L. Wahl, MD, FACS, FCCM

Disclosure Statement of Financial Interest

Zachary Laduke, Jason Hecht, and Wendy Wahl have nothing to disclose

Mark Hemmila and Anne Cain-Nielsen receive salary support from Blue Cross Blue Shield of Michigan and Blue Care Network for the administration of the Michigan Trauma Quality Improvement Program

The funding organization had no role in the design and conduct of the study; collection, management, analysis, and interpretation of the data; preparation, review, or approval of the manuscript; and decision to submit the manuscript for publication.

Background

- Pre-injury warfarin has been shown to increase morbidity and mortality despite effective reversal agents[1-3]
- Direct oral anticoagulants (DOACs) have been shown to have significantly less spontaneous major bleeding events compared to warfarin[4-8]
- Prior studies of outcomes following traumatic injury in patients on pre-injury DOACs are limited mostly to single center studies or isolated traumatic injuries[9-11]

Hypothesis

Traumatically injured patients on pre-injury DOACs will have lower mortality and complications than those patients injured while taking VKAs

Study Design

- Multicenter retrospective cohort study of 29 trauma centers in the Michigan Trauma Quality Improvement Program (MTQIP) registry
- Cohorts were stratified by pre-injury anticoagulation and antiplatelet agents
- Study dates: January 2012 – December 2017

Inclusion Criteria	Exclusion Criteria
• Age ≥ 16 years old • Trauma code on admission • Injury Severity Score (ISS) ≥ 5	• No signs of life on initial evaluation • Direct hospital – hospital transfer • Multiple anticoagulant agents

Statistical Analysis

- Multivariate logistic regression modeling used to account for differences in characteristics
- Goodness-of-fit was assessed and validated using c-statistics
- Primary Outcome:
  - Mortality or discharge to hospice
- Secondary Outcomes:
  - Serious in-hospital complications[1]
  - Resource utilization (ORs, transfusion in first 4 hours)

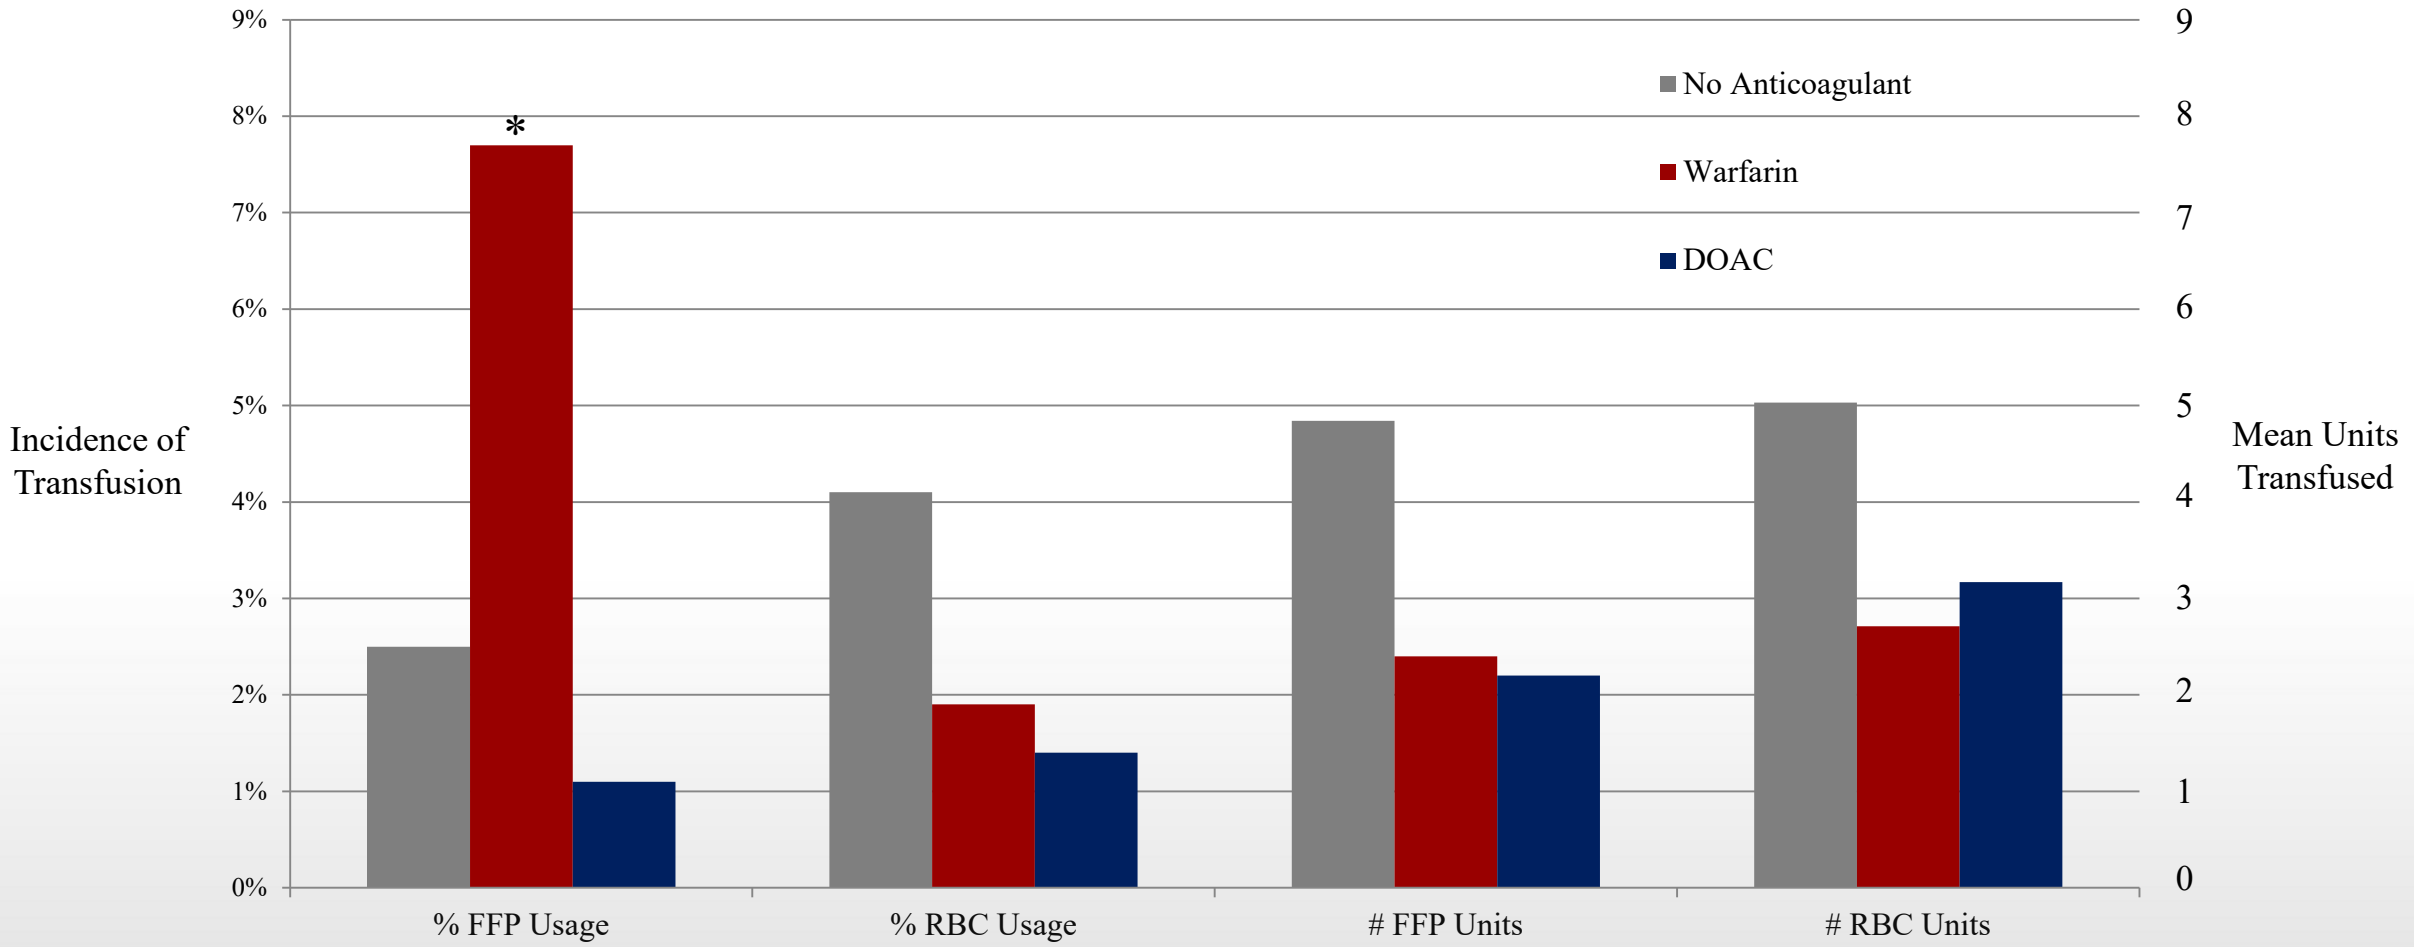
Mortality or Hospice

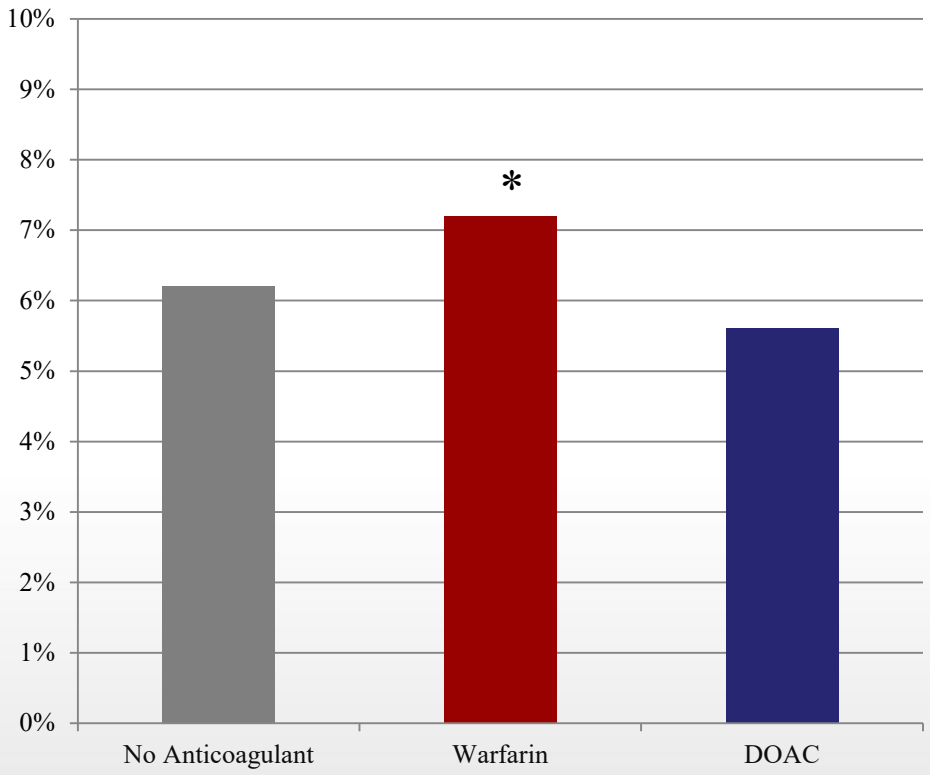
	No Anticoagulant	Warfarin	DOAC	Antiplatelet	Warfarin + AP	DOAC + AP
AOR (95% CI)	Reference	1.23 (1.04 – 1.44)	1.05 (0.81 – 1.71)	1.12 (1.01 – 1.24)	1.44 (1.10 – 1.88)	1.21 (0.90 – 1.63)

Resource Utilization



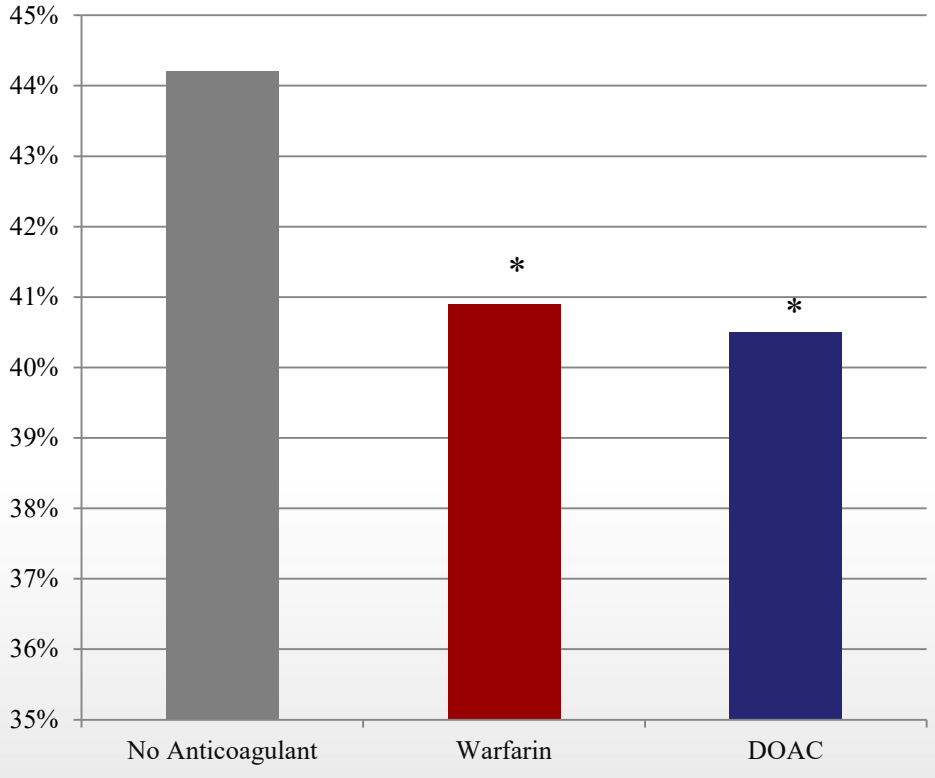
Resource Utilization

Serious Complications



Reference	1.19 (1.00 – 1.42)	1.03 (0.74 – 1.44)

Surgical Intervention



Reference	0.69 (0.56 – 0.85)	0.59 (0.47 – 0.73)

Study Limitations

- Unable to randomize patients prior to their traumatic injuries
- Reversal agents outside of blood products were not recorded in the registry until 2018
- Data was from level 1 and 2 trauma centers in Michigan so may not be applicable to other regions or classification of trauma systems
- Unable to account for patient frailty and potential biased prescribing towards warfarin
- Did not look at specific DOAC agents

Conclusions

- Compared to no anticoagulation, patients taking warfarin prior to traumatic injury have a higher incidence of mortality or hospice and serious complications
- Pre-injury DOAC was not associated with any difference in hospital outcomes as compared to no anticoagulation
- Pre-injury antiplatelet therapy alone and in combination with warfarin worsened outcomes
- This study contributes to the growing body of evidence showing the superior safety profiles of DOACs as compared to warfarin

Reviewer's comments

What about severely injured patients with high AIS?

How did the different DOAC agents do? Do factor IIa inhibitors (thrombin inhibitors) perform differently than Xa inhibitors?

Mortality/Discharge to Hospice for AIS of 3-5

Group	Odds Ratio [95% CI]	P value
Antiplatelet agent only	1.15 [1.03-1.28]	0.011
Warfarin+antiplt agent	1.39 [1.07-1.80]	0.012
Warfarin only	1.34 [1.137-1.60]	0.001
DOAC+antiplt agent	1.32 [0.996-1.75]	0.053
DOAC only	1.20 [0.86-1.68]	0.275

Serious Complications for AIS 3-5

Group	Odds Ratio [95% CI]	P value
Antiplatelet agent only	1.16 [1.05-1.26]	0.001
Warfarin+antiplt agent	1.29 [1.03-1.60]	0.021
Warfarin only	1.19 [0.998-1.41]	0.052
DOAC+antiplt agent	1.02 [0.68-1.51]	0.916
DOAC only	1.08 [0.81-1.43]	0.583

DOAC Comparison

group_split	Freq.	Percent	Cum.
Antiplatelet Only	23,196	20.16	20.16
Coumadin + Antiplatelet	1,893	1.65	21.81
Coumadin Only	3,855	3.35	25.16
Direct thrombin + Antiplatelet	137	0.12	25.28
Direct thrombin only (IIa inh)	197	0.17	25.45
Factor Xa + Antiplatelet	580	0.50	25.95
Factor Xa only	1109	0.96	26.92
None	84,075	73.08	100.00
Total	115,042	100.00	

Mortality/Discharge to Hospice for DOACs, Warfarin, Antiplatelet Agents Compared to None

Group	Odds Ratio [95% CI]	P value
Antiplatelet agent only	1.11 [1.01-1.24]	0.033
Warfarin+antiplt agent	1.43 [1.10-1.87]	0.008
Warfarin only	1.22 [1.04-1.43]	0.013
Thrombin inhib (aIIa+antiplt)	2.26 [1.25-4.10]	0.007
Thrombin inhib (anti-IIa)	1.09 [0.55-2.16]	0.785
Factor Xa inhibitor+antiplt	0.98 [0.70-1.3]	0.920
Factor Xa inhibitor only	1.04 [0.78-1.39]	0.758

Summary

- Patients on DOACs appear to have better outcomes than those on VKAs
- There appear to be differences among the types of DOACs, with Xa inhibitors associated with better outcomes
  - Small numbers
  - Platelet effect?

Summary

- The timing of reversal agents and which agents were used was not known for most of the study time period
  - More study will help us elucidate how to manage our injured patients on anticoagulants and antiplatelet agents

Thanks to all the MTQIP members!

Analytics Update

Jill Jakubus, PA-C

Participant Agreement Update

Rationale

- Updated standard for CQI's
- Expansion of services
- Requested clarification

Timeline

- May release

Questions

- jjakubus@med.umich.edu

Agreement Components	Purpose	Notes
Participation Agreement This Participation Agreement is effective the 1st day of May, 2019, by and between _____, located in _____, Michigan (hereinafter referred to as "PARTICIPANT") and the Regents of the University of Michigan, a Michigan constitutional corporation located in Ann Arbor, Michigan for the benefit of the Michigan Trauma Quality Improvement Program, (hereinafter referred to as "MTQIP"),	**Uses of data set**	**Replacing data use agreement**
Exhibit A **ELIGIBILITY AND EXPECTATIONS** **Participating Hospital Eligibility Requirements** **In order to be considered for participation in MTQIP a hospital must:** I. Operate an adult trauma program. II. Possess American College of Surgeons (ACS) Level 1 or 2 adult trauma center verification.	**Eligibility and expectations**	**Submission of all records clarified**
Exhibit B **HIPAA BUSINESS ASSOCIATE AGREEMENT** **THIS HIPAA BUSINESS ASSOCIATE AGREEMENT** ("BAA") is entered into effective the 1st day of May, 2019 ("Effective Date"), by and between __("Covered Entity"), and the Regents of the University of Michigan, a Michigan constitutional corporation for the benefit of the University of Michigan Coordinating Center for the Michigan Trauma Quality Improvement Program ("MTQIP") also referred to as ("Business Associate" "BA" or "UM").	**Use of PHI**	**New work with EMS linkage, patient reported outcomes, CQI sharing.**
Exhibit C **Limited Data Use Agreement** This data use agreement (the "Agreement") is by and between The Regents of the University of Michigan on behalf of its_____, ("UM") a Michigan constitutional corporation with its principal place of business in Ann Arbor, Michigan, and _____ ("Entity") and is effective as of _____ (the "Effective Date"). WHEREAS, UM and Entity are both engaged in research, public health, or other purposes permitted under 45 C.F.R. § 164.514(e):	**Allows use by of limited data sets by members**	

Agreement Components	Purpose	Notes
	**Sharing with anesthesia collaborative ASPIRE**	**Only sign if applicable**
	**Sharing with surgery collaborative MSQC**	**Only sign if applicable**

AMENDMENT NO. 1 TO
PARTICIPANT AGREEMENT

This Amendment No. 1 to Participant Agreement (PA) effective the 1st day of May, 2019 by and between the Regents of the University of Michigan, a Michigan constitutional corporation on behalf of its affiliates and _____ ("Participant") shall be effective the 1st day of May, 2019.

Participant is engaged in MTQIP:

These parties have agreed to amend the Agreement for the purpose of allowing Participant Data in MTQIP to be shared with the Anesthesiology Performance Improvement and Reporting Exchange (ASPIRE) a Blue Cross Blue Shield of Michigan (BCBSM) Collaborative Quality Initiatives (CQI's).

AMENDMENT NO. 2 TO
PARTICIPANT AGREEMENT

This Amendment No. 2 to Participant Agreement (PA) effective the 1st day of May, 2019 by and between the Regents of the University of Michigan, a Michigan constitutional corporation on behalf of its affiliates and _____("Participant") shall be effective the 1st day of May, 2019.

Participant is engaged in MTQIP:

These parties have agreed to amend the Agreement for the purpose of allowing Participant Data in MTQIP to be shared with Michigan Surgical Quality Collaborative (MSQC) a Blue Cross Blue Shield of Michigan (BCBSM) Collaborative Quality Initiatives (CQI's).

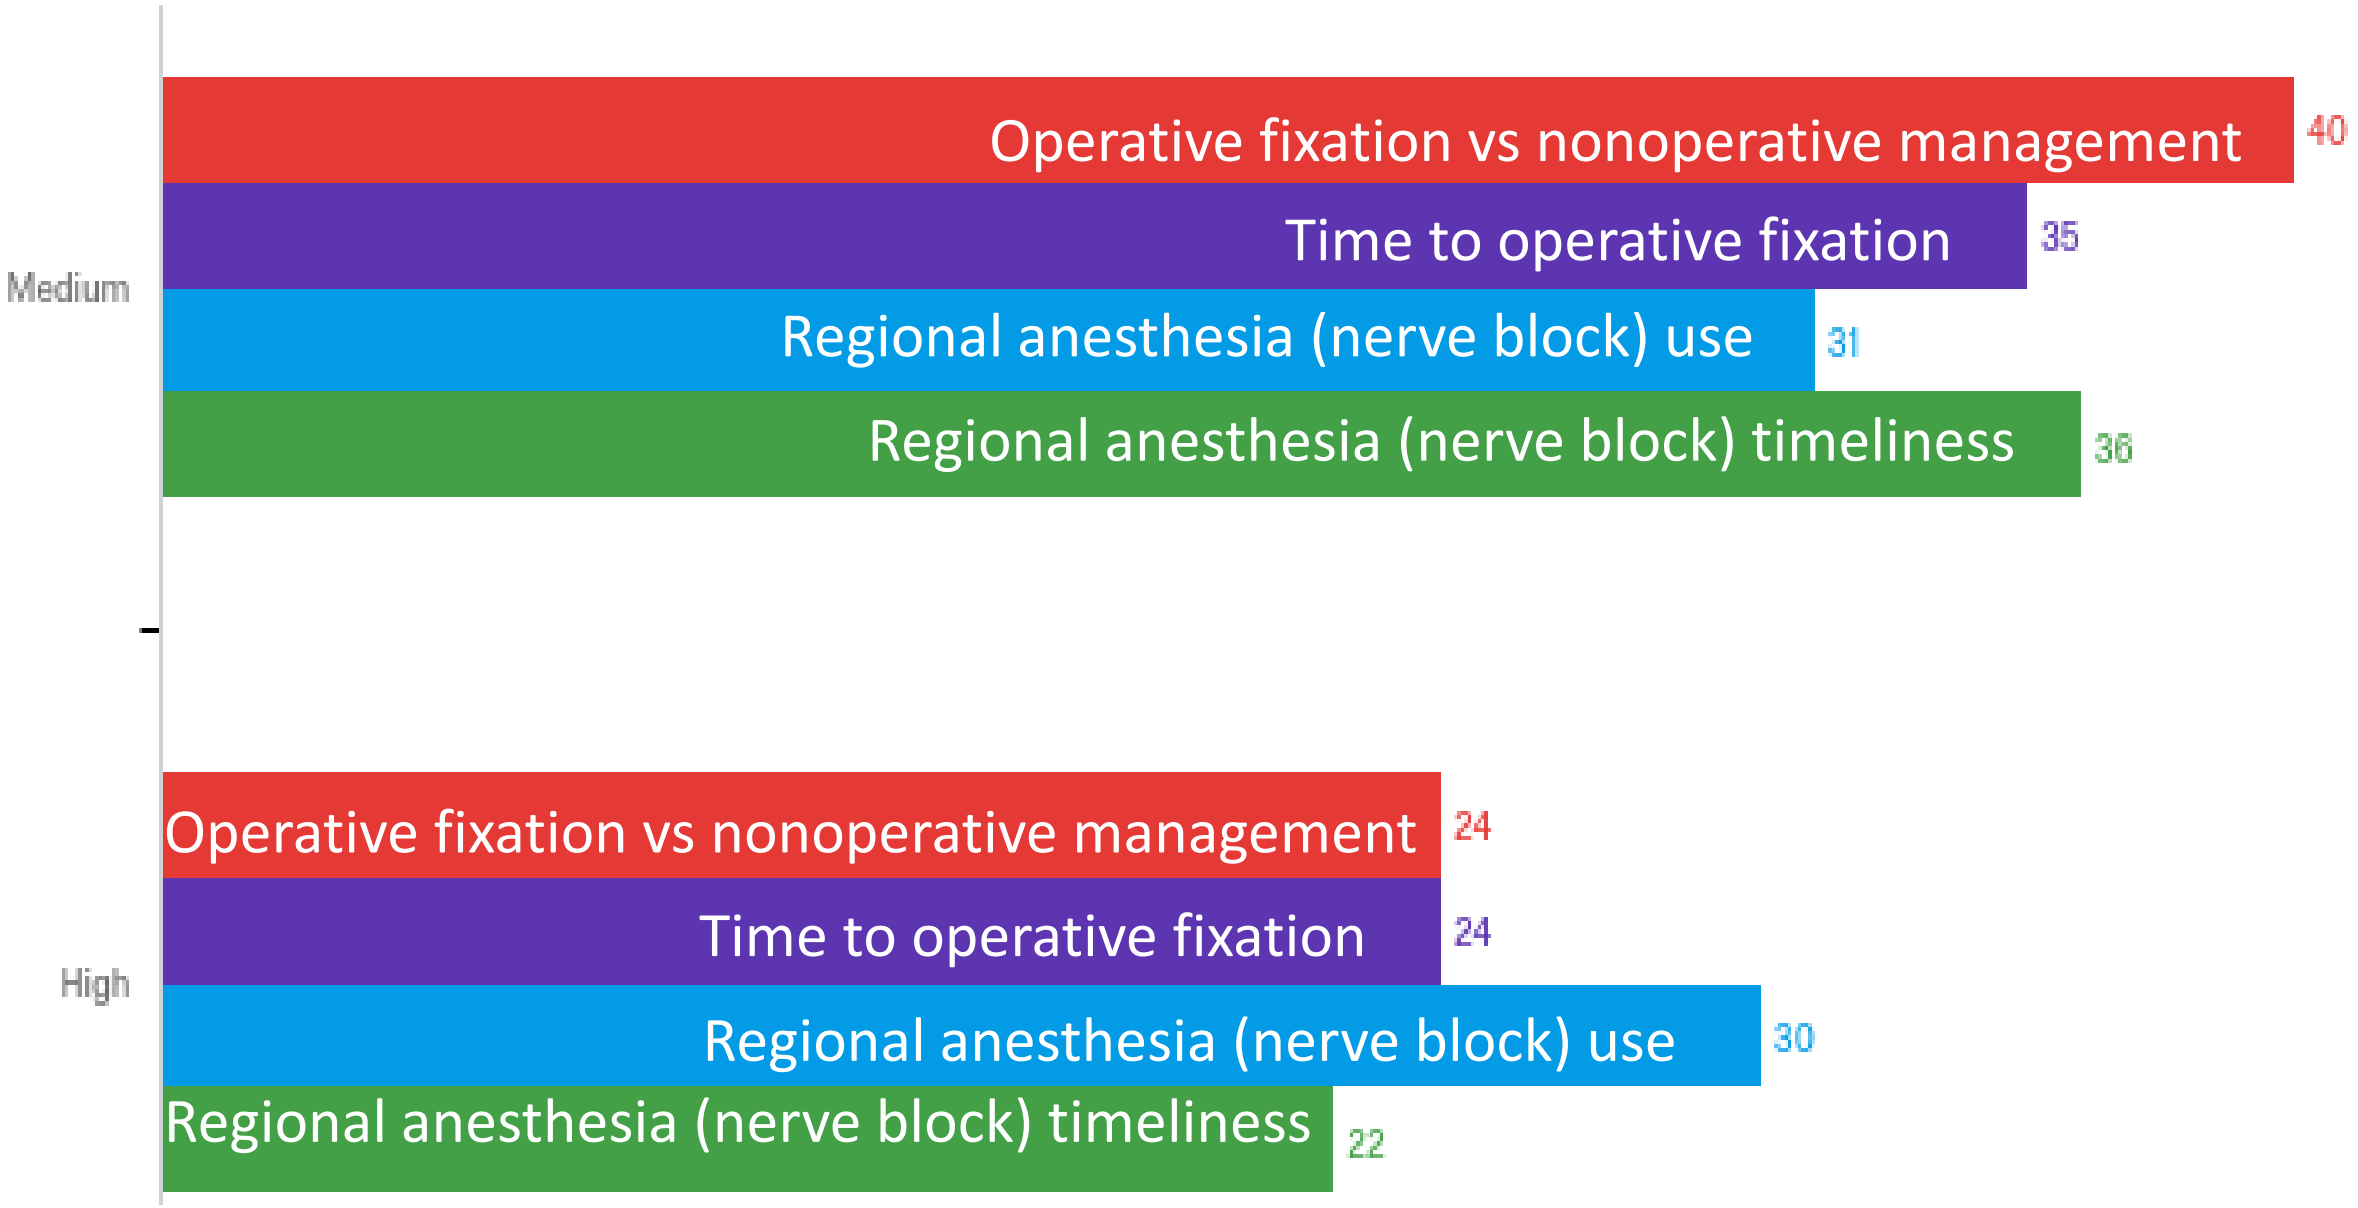
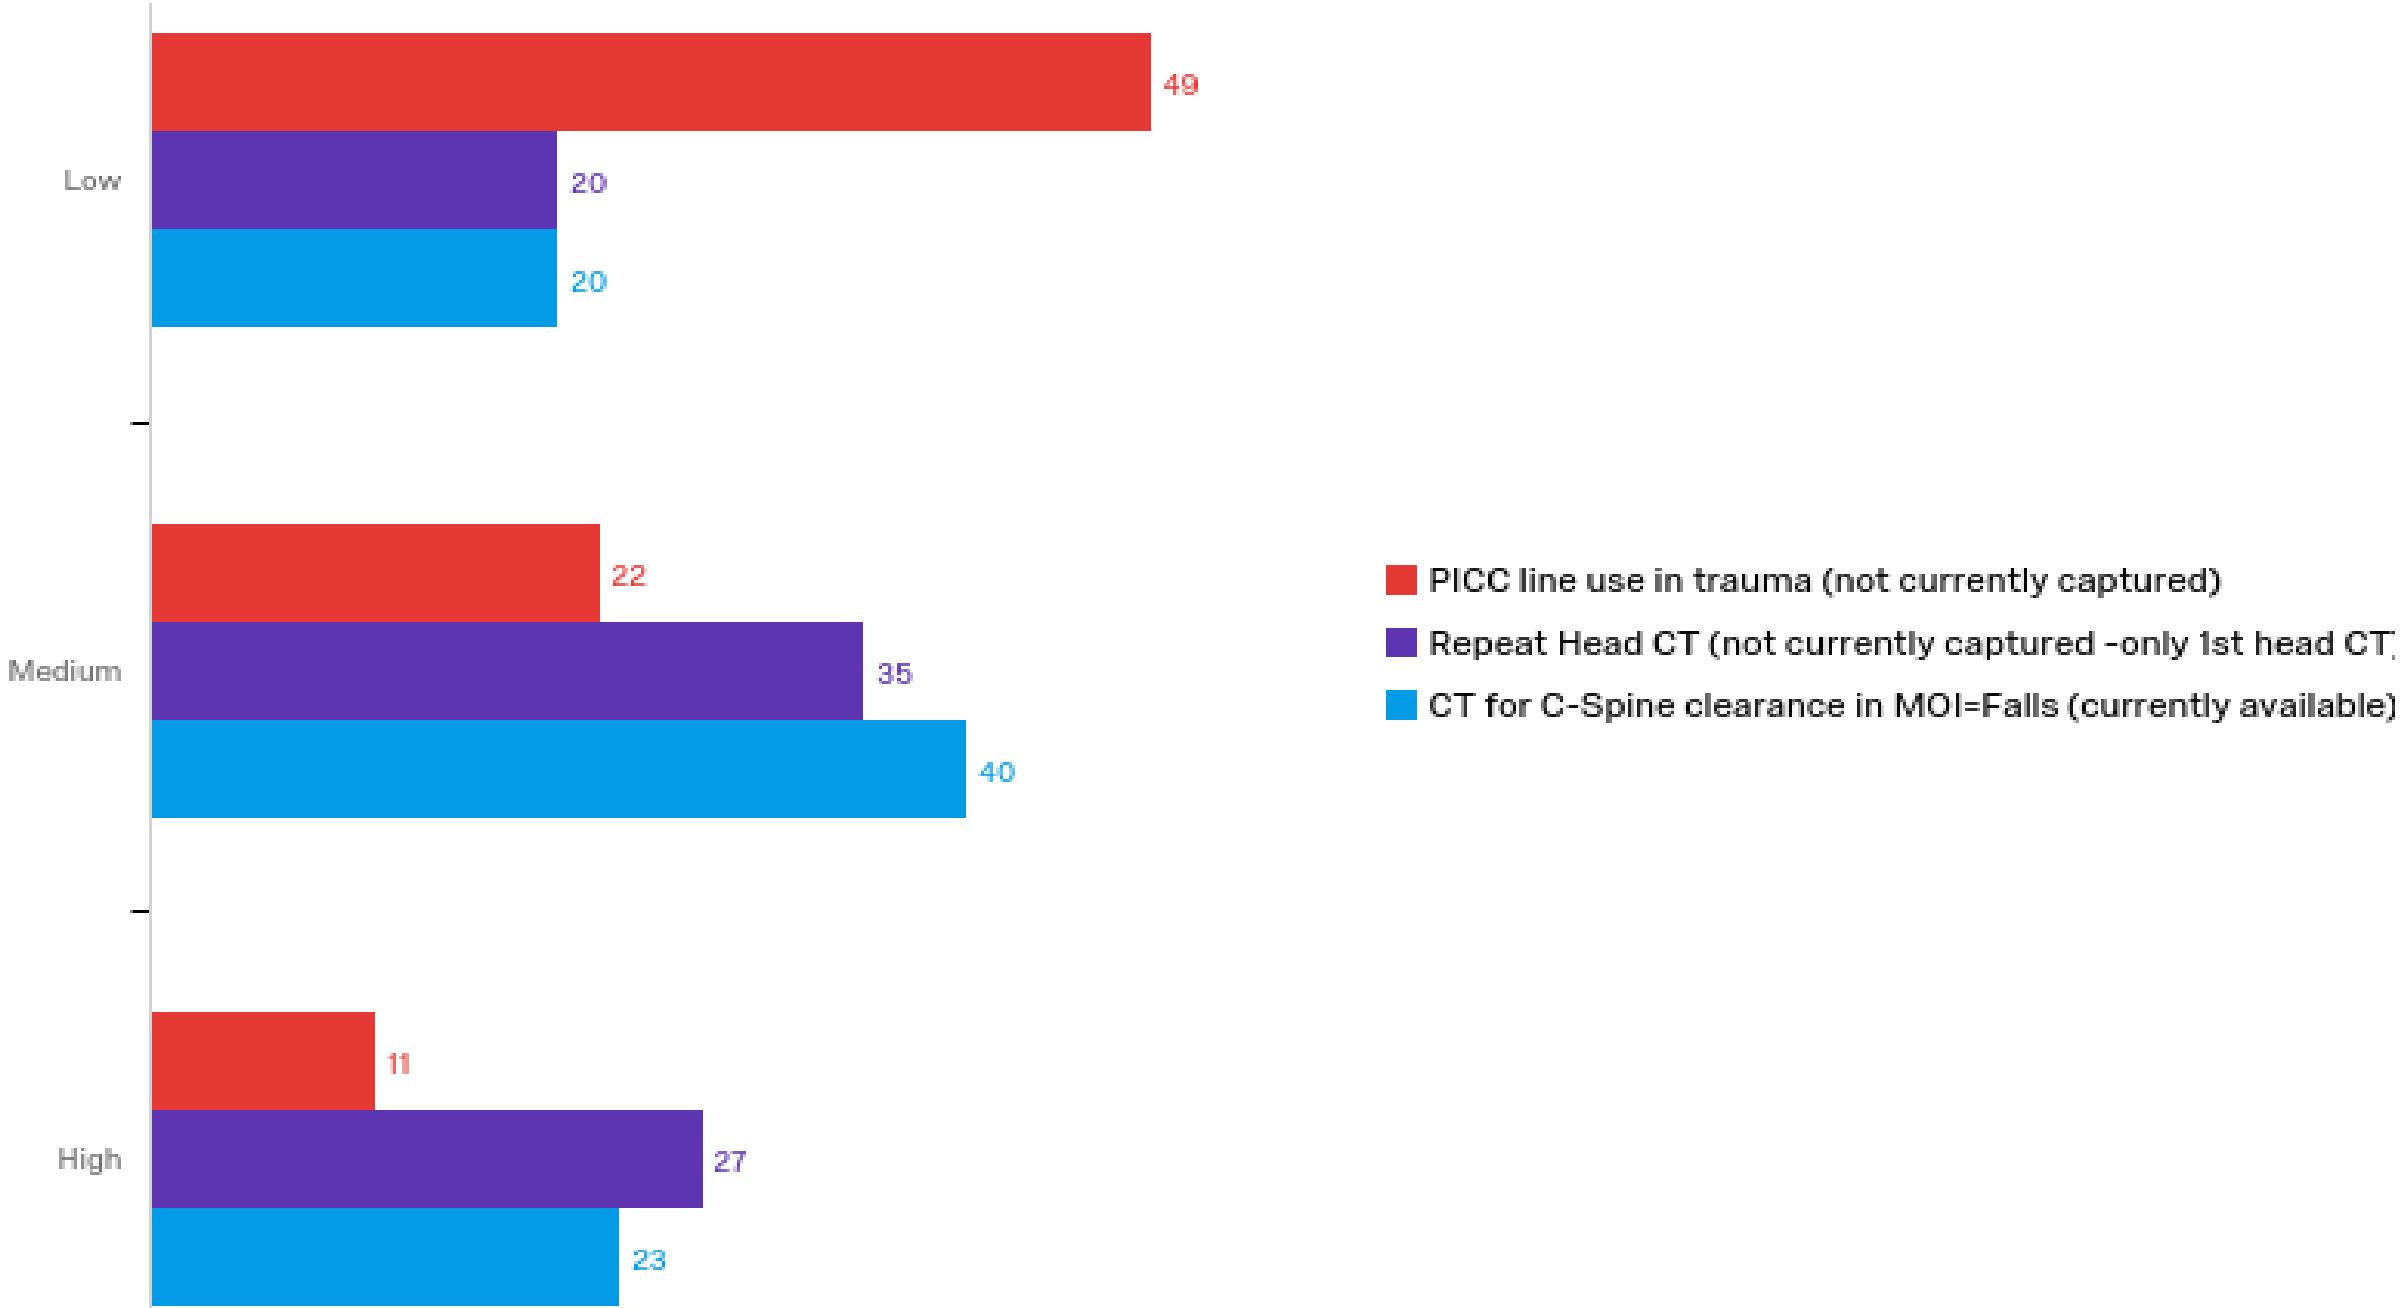
- Prothrombin complex concentrate (PCC) use in anticoagulated (currently avai...
- Activation criteria in anticoagulated (likely available-depends on criteria...

Q7 - Rib Fracture Measure Interest



Q8 - Overuse Measure Interest



Suggestions

✓Make sure measures are evidence based

General Trauma

- Hospital readmissions
- Non surgical admissions with ISS≥10
- Nutrition - severely injuries
- Door to thiamine time in alcoholics
- Acute Stress disorder (ASD) rather than PTSD

Suggestions

Pre-Hospital

- Helicopter transfer necessity

Resuscitation

- Whole blood vs component (several comments)
- TXA timeliness
- Plasmalyte vs NS
- REBOA use

Suggestions

Geriatric Hip Fractures

- “Really like the focus on geriatric factors”
- “While many of these geriatric hip fx measures are interesting I am not interested in making them performance measures unless there is evidence that one modality is superior to another”
- “I have concerns about hip fracture metrics since most are managed by orthopedics not trauma”

Geriatric Trauma Suggestions

- Osteoporosis workup referral (low energy) falls with fxs
- Palliative care consults
- Lactic acid/BE for initial labs for ground level falls
- Standardized lab work up geriatric (ground level falls)
- Pre/post op isolated hip fx fixation transfusion rates
- Geriatric transfusion standards
- Post op placement of comorbidities
- Nursing care initiatives for highly frail patients
- FVC or IS parameters -initial assessment

Suggestions

Traumatic Brain Injury

- Timeliness and appropriateness of reversal of geriatric head bleed by measurement of **time to first appropriate agent** as per 2017 ACC expert consensus
- Vitamin K in warfarin reversal

Overuse

- I am not sure that CT of c-spine in falls is an overuse--

  We have a very elderly population and a relatively high proportion of asymptomatic c-spine fractures in the fall population.

MTQIP
Death Classification Survey

2017 Deaths

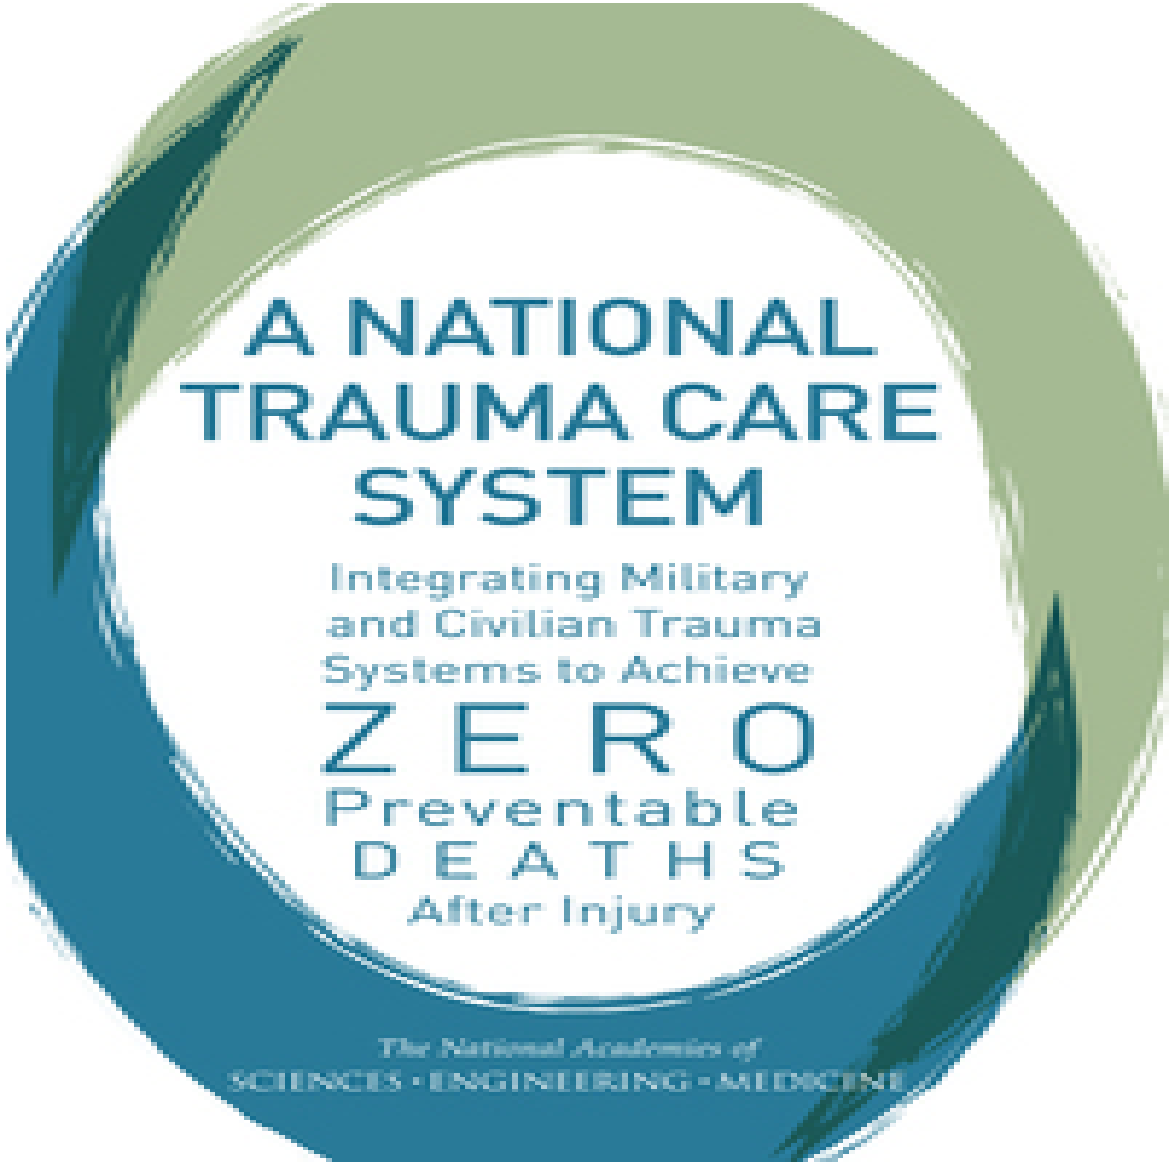
MTQIP 2017 Death Classification Survey

Why?
Informal ACS request for state estimate of death categories

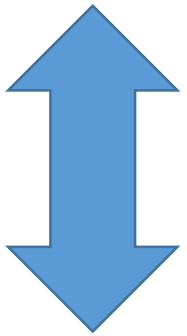
- Mortality with (W) opportunities for improvement (OFI)
- Mortality without (WO) opportunities for improvement (OFI)
- **Unanticipated mortality with (W) opportunities for improvement (OFI)**

Response Rate
31/34 centers = 91%

2016



Military Preventable Deaths



Civilian Unanticipated Mortality

NASEM Trauma Care Report 2016

- Who would benefit the most from a National Trauma System?
- U.S. Military: Approximately 1,000 potentially preventable deaths from combat trauma 2001-2011
- U.S. Civilian Sector: Approximately 20,000 to 30,000 potentially preventable deaths from trauma every year

Berwick, Downey, Cornett
JAMA 2016

Results

MTQIP
Unanticipated Deaths

- Of 31 Centers
- Total 1136 deaths
- 44 (4%) unanticipated deaths
- Extrapolate to 50 states
- 44 X 50 = 2200 deaths/year

National Trauma Care System
Zero Preventable Deaths

Acute Care Surgery – Economic Footprint

The Economic Footprint of Acute Care Surgery in the United States

Implications for Systems Development

Knowlton, Lisa Marie, M.D., M.P.H.[1]; Minei, Joseph, M.D., M.B.A[2]; Tennakoon, Lakshika, M.D.[1]; Davis, Kimberly A., M.D., M.B.A.[3]; Doucet, Jay, M.D.[4]; Bernard, Andrew, M.D.[5]; Haider, Adil, M.D., M.P.H.[6]; Tres Scherer, L.R. III, M.D., M.B.A.[7]; Spain, David A., M.D.[1]; Staudenmayer, Kristan L., M.D., M.S.[1]

Journal of Trauma and Acute Care Surgery: December 26, 2018 - Volume Publish Ahead of Print - Issue - p

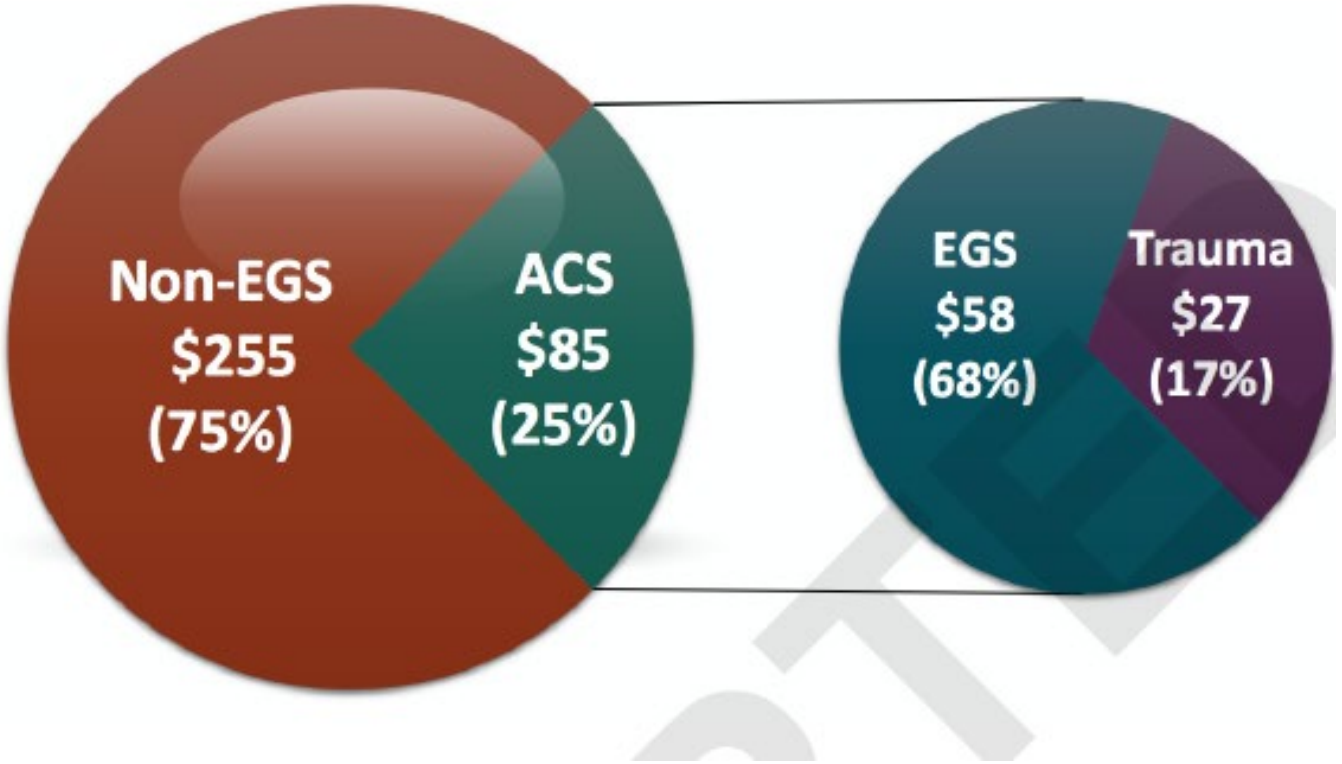
Acute Care Surgery – Economic Footprint

- National Inpatient Sample
- ICD-9
  - Trauma
  - 16 Emergent General Surgery Conditions
- 29 million patients
  - 20% ACS diagnosis
  - 25% of US inpatient costs
  - $86 Billion
- Inpatient operative procedure
  - 27% have an ACS diagnosis

Acute Care Surgery – Economic Footprint



Takeaway

- Prevalence - high
- Expense - high
- Problems - many

- Small iterative savings/improvements have potential for large impact overall

Projects and Preliminary Results

- Emergent General Surgery Data
  - Michigan Medicine
  - SCOAP
- Sharing Data Across CQI’s

Emergent General Surgery Data

- Michigan Medicine
- 2014 - 2018
- All touches of Acute Care Surgery Service
- 2,700 cases/year
- 1,200 cases/year get an operation
- Operation > MSQC case > MSQC data entry
  - Core
  - Oversampled
- Extra data
  - Appendicitis
  - Gall bladder disease
  - Operative
  - Non-operative

Emergent General Surgery Data

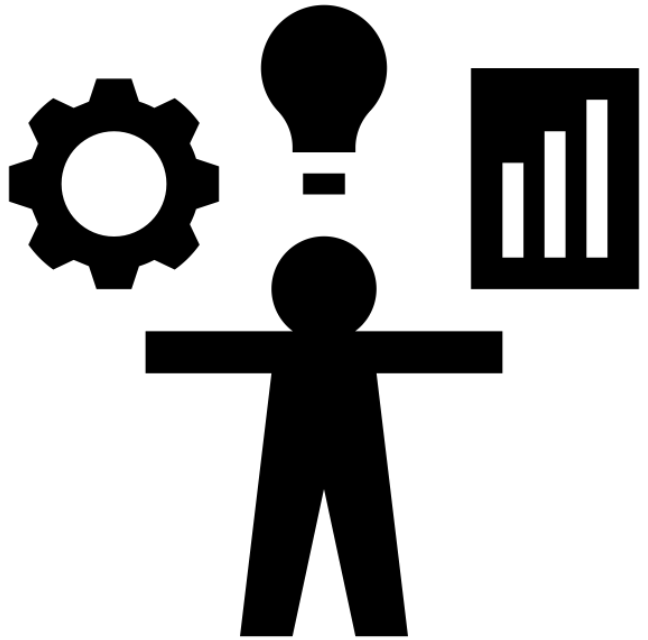
- Michigan Medicine
- 7/1/2018
- Qualtrics database
- All touches of Acute Care Surgery Service
- Extra Data
  - Appendicitis
  - Gall bladder disease
  - SBO
  - Ventral Hernia
  - Interventional Radiology Procedure
- SCOAP - SBO

Sharing of Data Across CQI

- ASPIRE
- Michigan Medicine Data for isolated hip fracture
- Initiating MTQIP and ASPIRE amendments
- Isolated hip fracture at MM
  - MRN and DOS +/- 1 day
  - 92% initial match rate
  - Eliminate patients with no operation or femur
  - 99.4% match

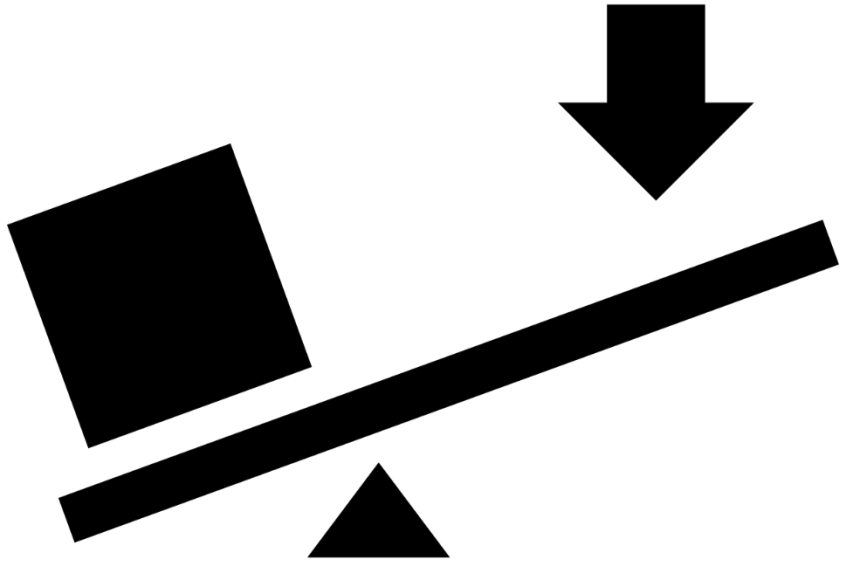
Future

- Impact, impact, impact
- Anticipate data needs
- 80/20 sweet spot
- Share across CQI’s
  - Data
  - Projects
- Broaden information reach



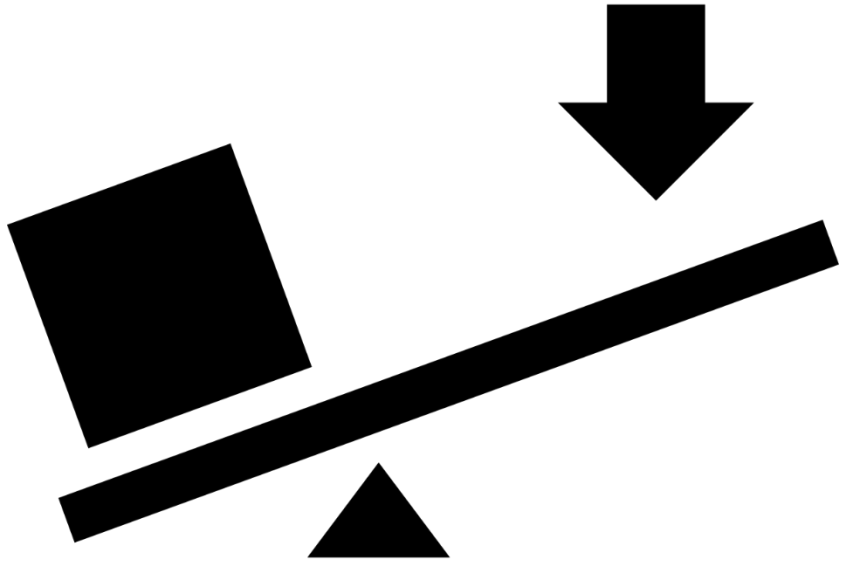
Summarize

- Emergent General Surgery
  - 4 hospitals
  - Select conditions (4-5)
  - Operative and non-op
- MSQC
- MTQIP
- Share data



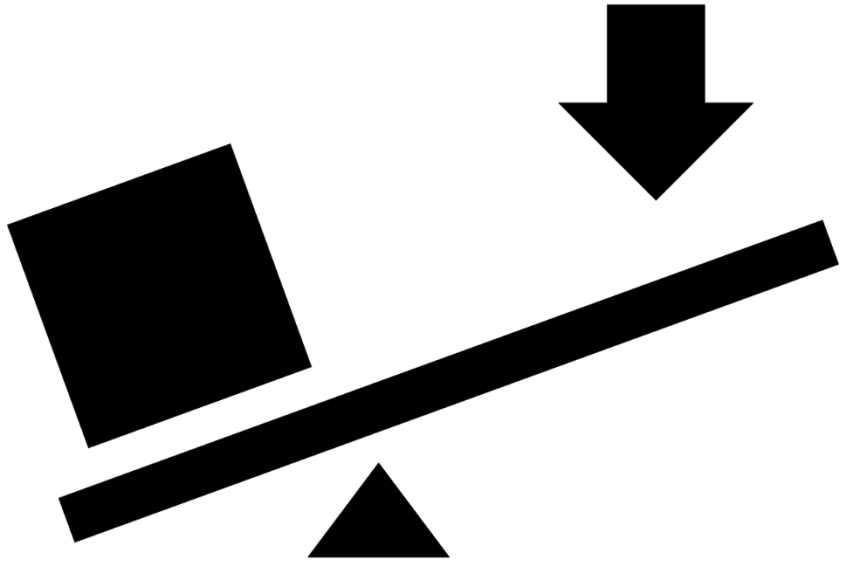
Update

- Targets
  - Centers identified
  - Sign documents
  - Onboard, train
  - Start data collection 7/19
- Meet
  - Review data collection
  - Adjust program
  - Set future agenda



Center Criteria

- MSQC and MTQIP
- Acute Care Surgery Model
  - Case capture
  - Buy in
- Ability to access funding for data collection
- EPIC +/-
- ASPIRE +/-



Logistics

- MTQIP documents
  - Participation agreement
  - Exhibit A (expectations)
  - Exhibit B (existing BAA)
  - Amendment 1 (share ASPIRE)
  - Amendment 2 (share MSQC)
- Data Definitions Manual
- Training
- Oversample cases
- Qualtrics
